# 1 Executive Summary

Sloughhouse Solar, LLC (Applicant) is proposing construction and operation of the Sloughhouse Solar Project (Project), a solar PV energy-generating facility adjacent to an existing solar energy facility located in the Sloughhouse community of Sacramento County, California. A Project Study Area (PSA) of 732.26 acres was evaluated for this Biological Assessment (BA). The PSA comprises the Action Area, which comprises the Solar Development Area (i.e., the area direct or indirectly affected by the federal action) of 371.72 acres, in addition to the remaining areas outside of the Solar Development Area but within the Action Area, which will be referred to herein as “Adjacent Other Lands” of 360.54 acres. For the Action Area, this BA analyzes the preferred environmental alternative site plan dated June 2022 (DESRI 2022).

In accordance with the 50 Code of Federal Regulations (CFR) 402.14(c), this document provides the necessary information in support of the U.S. Department of Agriculture (USDA) request to initiate Formal Consultation with the U.S. Fish and Wildlife Service (USFWS) and request their Biological Opinion (BO) for potential affects to three federally listed species and their habitat, vernal pool fairy shrimp (*Branchinecta lynchi*), vernal pool tadpole shrimp (*Lepidurus packardii*), and valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*). The USDA is the lead federal action agency regarding the consultation pursuant to 50 C.F.R. § 402.07. This document will also serve as the BA regarding the actions of the U.S. Army Corps of Engineers (USACE) for the Project.

INTENTIONALLY LEFT BLANK

---

## 2 Introduction

In accordance with the 50 Code of Federal Regulations (CFR) sections 402.12 and 402.14(c), this Biological Assessment (BA) was prepared for the Sloughhouse Solar Project (Project or Proposed Action) to provide the necessary information in support of the U.S. Department of Agriculture's (USDA) request to initiate Formal Consultation with the U.S. Fish and Wildlife Service (USFWS) and request their Biological Opinion (BO) for potential effects to three federally listed species, vernal pool tadpole shrimp, vernal pool fairy shrimp, and valley elderberry longhorn beetle.

### 2.1 Purpose of Biological Assessment

The purpose of this BA is to provide the USFWS with the information required for the preparation of a BO. This BA describes the potential direct, indirect, and temporary effects of the proposed Project on the federally listed vernal pool tadpole shrimp, vernal pool fairy shrimp, and valley elderberry longhorn beetle in accordance with Section 7 of the Federal Endangered Species Act (FESA). This BA is provided in support of USDA's request for the initiation of Formal Consultation with the USFWS for the incidental take (defined below) of vernal pool tadpole shrimp and vernal pool fairy shrimp, and on designated or proposed critical habitat for these species. The geographic scope of this BA encompasses a Project Study Area (PSA), or Action Area, of 732.26 acres. The Action Area has been defined based on the areas that may be directly and/or indirectly affected by the Proposed Action. Specifically, the Action Area encompasses the entire geographic area whereby the Proposed Action will directly and indirectly affect physical, chemical, and biological resources. Additionally, solar development is limited to the Action Area and has minimal impacts beyond the Solar development area. For the Proposed Action, the Action Area comprises the Solar Development Area (i.e., the area direct or indirectly affected by the federal action) of 371.72 acres, in addition to the remaining areas outside of the Solar Development Area within the Action Area, which will be referred to herein as "Adjacent Other Lands" of 360.54 acres (Figures 1-3; Appendix A). The Action Area was originally defined based on the maximum extent of the landowner parcels. These areas were initially surveyed to locate a site for the Solar Development Area that would reduce environmental impacts to the maximum extent possible, as well as to determine if areas within the parcels had the potential to be used for mitigation purposes. The area to the east of the Action Area was not included as part of the Action Area because it lacks aquatic resources within proximity to the Proposed Action and will not yield any direct or indirect impacts. For the Action Area, this BA analyzes the final preferred environmental alternative site plan dated June 2022 (DESRI 2022). Specifically, this BA has been prepared in compliance with legal requirements set forth under 50 C.F.R. sections 402.12 and 402.14, and Section 7(b) of FESA with the following objectives:

- Provide the best available scientific and commercial data and information to USFWS about the species and habitats addressed in this BA and how they may be affected by the Proposed Action, including consideration of cumulative effects.
- Determine whether the species addressed in this BA are likely to be adversely affected by the Proposed Action.
- Determine if designated or proposed critical habitat would be adversely modified by the Proposed Action.

- Describe conservation measures for the Proposed Action that would avoid or minimize its effects on these species and their habitats.

## 2.2 Consultation Considerations

### 2.2.1 Species Considered

An official list of federally listed species that may be present within 5 miles of the Action Area was obtained from the USFWS Information for Planning and Conservation (IPaC) database in July 2022 (USFWS 2022a) (Appendix B). The following eight federally endangered and threatened species were included on the USFWS species list and were considered for inclusion in this BA based on their potential for occurrence and effects of the action:

- Wildlife
  - California tiger salamander (*Ambystoma californiense*)—threatened.
  - Steelhead (*Oncorhynchus mykiss*)—threatened.
  - Giant garter snake (*Thamnophis gigas*)—threatened.
  - Valley elderberry longhorn beetle—threatened.
  - Vernal pool fairy shrimp—threatened.
  - Vernal pool tadpole shrimp—endangered.
- Plants
  - Sacramento Orcutt grass (*Orcuttia viscida*)—endangered.
  - Slender Orcutt grass (*Orcuttia tenuis*)—threatened.

The USFWS IPaC database results also identified critical habitats for vernal pool fairy shrimp, vernal pool tadpole shrimp, Sacramento Orcutt grass, and Slender Orcutt grass (USFWS 2022a) (Appendix B, Figure 8).

### 2.2.2 Species Eliminated

Based on the lack of known occurrences, the Proposed Action will have “no affect” and/or will “not likely to adversely affect” the federally listed species described below. Therefore, these species have been eliminated in this BA and no further evaluation or consultation on these species is needed (50 Code of Federal Regulations [CFR] 402.12).

- California tiger salamander- The Action Area is within the range of the California tiger salamander; the nearest occurrence of this species was determined to be approximately 5 miles from the Action Area, beyond the dispersal distance for the species. Few to no suitable burrows were identified during surveys,

and no California tiger salamander or larvae were detected during focused surveys (SLLC 2022a) (Appendix G).

- **Steelhead-** The Action Area does not contain suitable habitat for spawning and rearing steelhead, as it lacks necessary shade, suitable spawning substrate, and shallow, riffled waters; however, does contain potential migration habitat/corridor. This species has known occurrences within the small portion of the Cosumnes River that runs along the west side of the Action Area. The Consumes River that runs along the western boundary of the Action Area is hydrologically separated by a large levee from all areas to the east (i.e., the remaining Adjacent Other Lands and the Solar Development Area). As such, this species has been eliminated from this consultation because there will be no indirect, temporary, or direct impacts to the steelhead or their habitat (SLLC 2022a) (Appendix G).
- **Giant garter snake-** The Action Area is not within the current range of giant garter snake. Giant garter snake has not been documented in the vicinity of the Action Area and the habitat in the Action Area is of low quality. There are no known occurrences within 5 miles of the Action Area (SLLC 2022a) (Appendix G).
- **Sacramento Orcutt and Slender Orcutt grasses-** Reference population checks were performed for special-status plant species on April 22, 2021, and protocol-level botanical field surveys were conducted within the Action Area on May 4, 2021. The Action Area is within the known range of Sacramento Orcutt Grass and slender Orcutt grass, and low quality suitable habitat for the species is present. Specifically, the low quality suitable habitat for this species is located throughout the Action Area within the vernal pools, wetland swales, and seasonal wetlands. Designated Critical Habitat (DCH) is located approximately 4 miles northwest of the Action Area. There are also known occurrences for this species within 5 miles of the Action Area, including locations off Kiefer Boulevard near the intersection with Grant Line Road. No Sacramento Orcutt grass or slender Orcutt grass was observed during protocol-level botanical surveys (SLLC 2022a) (Appendix G).

### 2.2.3 Designated Critical Habitat

USFWS has DCH for special-status invertebrate species vernal pool fairy shrimp and vernal pool tadpole shrimp (SLLC 2022) (Appendices B and G). DCH for vernal pool fairy shrimp and vernal pool tadpole shrimp have both been identified within 5 miles of the Action Area, with the closest located approximately 1.3 miles southeast of the Action Area (Figure 8). Protection and recovery requisites for these species are detailed in the *2005 Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon* (USFWS 2005a). These species have an ephemeral life cycle and exist only in vernal pools or vernal pool-like habitats, such as those occurring within the Action Area. The overarching recovery strategy for these species is habitat protection and management (USFWS 2005a).

### 2.2.4 Species Requiring Consultation

Of the 8 federally listed species considered for inclusion in this BA, three species, vernal pool fairy shrimp, vernal pool tadpole shrimp, and valley elderberry longhorn beetle have been considered for potential effects within the Action Area and are therefore the subject species assessed within this BA.

## 2.2.5 Consultation to Date

Pursuant to FESA, USDA must consult with USFWS regarding any proposed actions USDA authorizes that may affect the continued existence of a federally listed species. No formal consultation on the Proposed Action between USDA and USFWS has occurred to date.

**Table 1. Summary of Consultation to Date, Sloughhouse Solar Project**

Date	Attendance / Recipients	Consultation / Correspondence Notes
	David Hochart (Dudek); Steve Smith and Matthew Gerken (Aecom)	
07.12.2022	Elisa Albury, Jeffrey Larson (USDA); Clark Skillman (SLLC); Matt Hirkala (USACE); Morgan Kennedy, David Hochart (Dudek); Steve Smith and Matthew Gerken (Aecom)	Meeting #4: USDA, federal lead, coordination meeting with other federal agencies

**Notes:** SLLC= Sloughhouse Solar, LLC; USDA= U.S. Department of Agriculture, USACE= U.S. Army Corps of Engineers, USFWS= U.S. Fish and Wildlife Service.

On January 20, 2021, the Applicant conducted a formal pre-application meeting with the USFWS (i.e., meeting #1). The pre-application meeting introduced the Applicant and USFWS teams, the Project site, overarching Project objectives, and provided a background of known federally listed species that may be present within the Action Area. During this pre-application meeting the USFWS indicated a Project manager had not yet been assigned to the Project. Discussions regarding the applicability of the South Sacramento Habitat Conservation Plan (SSHCP) were reviewed, and the Project was determined not to be a covered activity. Lastly, the findings of the Protocol-Level Dry and Wet Season Survey Results for federally listed branchiopods were presented to the USFWS.

On December 15, 2021, the Applicant conducted a follow-up pre-application meeting with USFWS (i.e., meeting #2). This follow-up meeting included the attendance of the newly assigned Ian Perkins-Taylor as the USFWS Project manager for the Project. Mr. Perkins indicated at this time that the USFWS would assume presence for federal large-listed branchiopods within the Action Area, even with the negative protocol-level survey results conducted in the dry and wet seasons of 2020 and 2021. A review of the Project and updated site plans to date were reviewed, as well as discussions regarding the process for moving forward with a formal Section 7 Consultation.

On June 2, 2022, the Applicant team met with both the USFWS and the USACE for a site visit of the Action Area. The entirety of the site and surround area was visited. Aquatic resources were reviewed to assess for suitability of habitat for federally large-listed branchiopod species. In addition, discussions were initiated to evaluate the best approaches for compensatory mitigation for the Project.

On July 12, 2022, the Applicant team met with the USFWS, the USACE, and the USDA, the federal lead agency, to discuss each federal agency's role. The USDA led the discussion and provided feedback on the process and timing for submittal and permit reviews.

## 3 Description of Proposed Action

### 3.1 Overview

The Proposed Action is a solar photovoltaic (PV) energy-generating facility located on the southwest corner of Meiss Road and Dillard Road, adjacent to an existing solar energy facility located at 7794 Dillard Road, Sacramento County, California. The Project is being proposed to be developed by the Applicant to sell its electricity and all renewable and environmental attributes to Sacramento Municipal Utility District (SMUD) under long-term contracts to help meet California Renewables Portfolio Standard goals. The Project Applicant would construct, operate, and decommission a solar generation and energy storage facility within the Solar Development Areas of approximately 371.72 acres (inclusive of solar field, energy storage, substation(s), roads, retention basins, etc.) within the greater 732.26-acre Action Area. The remaining 360.54 acres within the Action Area are being included in this BA to be referred to as Adjacent Other Lands (Figures 1-3, Appendix A). The design and construction of the buildings, solar arrays (panels, etc.), energy storage facilities, and auxiliary facilities will be consistent with Sacramento County building standards. During construction, a temporary construction trailer/office complex and staging areas would be established within the Action Area. At the end of the Project's life (anticipated to be 30 to 35 years or longer), the site would be decommissioned.

The Proposed Action will use PV technology to convert sunlight directly into direct current (DC) electricity. The process starts with PV cells that make up PV modules (environmentally sealed collections of PV cells). Groups of PV modules are wired together to form a PV array. The DC produced by the array is collected at inverters (power conversion devices) where the DC is converted to alternating current (AC). The voltage of the electricity is increased by a transformer at each power conversion station to a medium voltage level (typically 34.5 kilovolts). Medium voltage electric lines (underground and/or overhead) are used to collect the electricity from each medium voltage transformer and transmit it to the facility substation, where the voltage is further increased by a high voltage transformer to match the electric grid for export to the point of interconnection along Dillard Road. Disconnect switches, fuses, circuit breakers, and other miscellaneous equipment will be installed throughout the system for electrical protection and operations and maintenance purposes. The Proposed Action may include only one PV technology or a combination of various PV technologies, including but not limited to crystalline silicon-based systems, bifacial, thin-film systems, perovskites, and concentrating PV systems.

### 3.2 Layout

The Solar Development Area will include a powerline crossing of Dillard Road and access from Dillard Road. The Solar Development Area consists of a solar PV generating facility approximately 50 megawatts in size. The ultimate energy output is dependent on several variables, including offtake arrangements and the evolving efficiency of PV panels, so it is possible that the Project could generate more or less than 50 megawatts. Proposed Action construction will take approximately 8 months.

At full build-out, most of the Solar Development Area will be disturbed by construction of the Proposed Action. Temporary construction lay down, construction trailers, and parking areas will be provided within the Solar Development Area. Due to the size of the Solar Development Area, the solar field lay down areas may be relocated periodically within the solar field acreage as the Proposed Action is built out in phases.

The Solar Development Area may also include additional auxiliary facilities such as raw water/fire water storage, treated water storage, storm water retention basins, water filtration buildings and equipment, and equipment control buildings, septic system(s), and parking. The design and construction of the buildings, solar arrays (panels, etc.), energy storage facilities, and auxiliary facilities will be consistent with Sacramento County building standards.

## 3.2.1 Facilities

The Solar Development Area consists of a solar PV generating facility approximately 50 MW in size. The major components of the Solar Development Area facilities are described below.

### 3.2.1.1 PV Solar Modules

The Project will utilize PV modules. When sunlight strikes a PV module, the energy absorbed is transferred to electrons in the atoms of the semiconductor causing them to escape from their normal positions and become part of the current in an electrical circuit. The PV modules convert the sunlight directly into low-voltage DC electricity that is subsequently transformed to AC electricity through an inverter. The system only operates when the sun is shining during daylight hours. The system operates at peak output when the sunlight is most intense, though it also produces power in low light conditions.

### 3.2.1.2 Fixed-Tilt and Tracker Structures

Depending on the selected manufacturer for the PV modules, the modules will be mounted on fixed-tilt, single or dual-axis tracking structures. The modules will be grouped in nominal 1 to 2MW-AC arrays. Fixed tilt arrays will be oriented in east-west rows and will face in a generally southern orientation with a tilt angle between 10 and 35 degrees to maximize the amount of incidental solar radiation absorbed over the year. Single-axis trackers typically rotate  $\pm 60$  degrees (0 degrees is horizontal) along a nominally north-south axis to track the sun's movement throughout the day. Structural support elements will be constructed of corrosion-resistant steel, aluminum, or equivalent members that are attached to circular piers or I-beam posts that will be driven into the prepared base grade of the Solar Development Area.

### 3.2.1.3 Inverters and Pad-Mounted Transformers

At the center of each array is a power conversion station where inverters take the DC power output from the PV modules and convert it to AC power. The adjacent pad-mounted transformer steps the voltage up to a medium voltage level. The medium voltage outputs from each of the pad-mounted transformers are collected in combining switchgear located at discrete locations within the Solar Development Area. The medium voltage output from the combining switchgear will be connected to the Project substation within the Solar Development Area where it will then be stepped up to 69 kV for export to the grid. The solar array field is arranged in groups called "blocks." The entire array block is connected to an inverter and transformer station to convert the current from DC to AC and step up the voltage to a higher voltage which is more efficient for transmitting power to the substation.

### 3.2.1.4 Substation and Switchyard

An onsite substation will step-up the voltage from the collection level voltage to 69 kilovolts. Breakers, bus work, protective relaying, Supervisory Control and Data Acquisition (SCADA), and associated substation equipment will be constructed on the Solar Development Area. The communication system may include above or below ground fiber

optic cable or microwave tower. The Project will be interconnected to the regional transmission system from the onsite substation/switchyard via the gen-tie facilities described in this Description of Proposed Action.

### 3.2.1.5 Transmission Interconnection Facilities

The Project plans to connect to SMUD 69 kilovolt powerlines.

### 3.2.1.6 Energy Storage

The Solar Development Area will incorporate a battery energy storage facility as well as energy storage being housed within the inverters. The field of energy storage is rapidly advancing; thus, a single technology or provider has not been selected for the energy storage portion of the Project. The storage component may be centralized and located adjacent to the substation or switchgear, or alternatively, the energy storage component may be distributed throughout the plant adjacent to individual power conversion centers. The storage component would be housed in a warehouse type building or alternatively in smaller modular structures such as cargo shipping containers.

## 3.3 Construction and Operations

The following Project-systems will control, protect, and support the Proposed Action construction and its operation as described in the following in the sections below.

### 3.3.1 Temporary Construction Facilities

During construction, temporary facilities will be developed within the Solar Development Area to facilitate the construction process. These facilities may include construction trailers, temporary septic systems or holding tanks, parking areas, material receiving / storage areas, water storage ponds, construction power service, recycling / waste handling areas, and others. These facilities will be located at the construction areas designated on the final site plan.

### 3.3.2 Grading and Drainage

Site preparation will be planned and designed to minimize the amount of earth movement required for the Solar Development Area, to the extent feasible. Grading will consist of disc and roll compaction over the site. The hydrology design will be given priority to protect the Project's facilities and adjacent facilities from large storm events. It is the intent of the Project to support the panels on driven piles. Additional compaction of the soil to support the building and traffic loads as well as the PV module supports may be required and is dependent on final Project engineering design. Areas of significant compaction beneath the array are anticipated to be recompacted to foster vegetation growth following construction activities. The onsite drainage patterns will be maintained to the maximum extent practicable.

### 3.3.3 Water Use

The Project anticipates the use of existing on-site wells; however, some water may need to be hauled onsite dependent on water use needs in dry conditions. During construction within the Solar Development Area, water will be required for a variety of construction activities, including dust suppression, earth compaction, the creation of

engineered fill, and concrete preparation. Construction-phase water demand will be greatest during site grading which will consist of disc and roll compaction over the site. Approximately 96 acre-feet of water will be used for Solar Development Area dust control and other construction activities during the construction phase of the Proposed Action. The water used during operation will be used primarily for dust control. The Proposed Action may also use water to wash the solar modules should it be determined to be beneficial to the Project. The Proposed Action anticipates a requirement of approximately 2 acre-feet per year during plant operation (Dudek 2021).

### 3.3.4 Access / Traffic and Circulation

Access to the Solar Development Area will be from Dillard Road and Meiss Road. Access to components of the solar field will be controlled through security gates at several entrances. Multiple gate restricted access points will be used during construction and operation.

Proposed Action Construction is expected to take approximately 8 months. Daily trip generation during the Proposed Action construction would be from delivery of equipment and supplies and the commuting of the construction workforce. The number of workers expected onsite during Proposed Action construction would vary over the construction period and will average up to 150 workers per day. Deliveries of equipment and supplies to the site would also vary over the construction period but have the potential to range from 5 to 40 daily trips, averaging approximately 10 daily trips during the construction period. Parking for Proposed Action-related vehicles will be provided within the Solar Development Area during construction. The parking lot will move to adjacent phases as new phases are constructed. Based on the expected trips generated, traffic on the local roads would increase during construction but affects to current traffic patterns are anticipated to be minimal. No impact to current traffic patterns would result during operation of the Proposed Action. Operation of the site would be expected to generate approximately 4 to 10 trips per day from maintenance and security personnel.

### 3.3.5 Noise

Noise may be generated by equipment within the substation; typically, this includes switches, protection and control equipment, transformers, and the incoming transmission lines. The noise generated by transmission lines and switches has previously been analyzed to be 25 decibels at 50 feet. Transformers within the substation would generate noise levels like those at the inverters. Substation switches do not generate an audible noise, and circuit breakers (70 decibels at 65 feet) would not be a common noise source, as they would only operate for short periods of time during an emergency event to protect the switches and transformers within the substation. The project inverters will also generate noise. However, inverter noise decreases to background sound levels relatively quickly, and noise is anticipated to be essentially imperceptible at the fence line of the facility. Background sound levels are anticipated to dissipate within 50 to 150 feet of the facilities (MCEC 2012).

### 3.3.6 Electric Service

Permanent electric service will be obtained for auxiliary loads. Service will be provided by SMUD. Temporary electric service will be obtained for primary construction logistical areas. Generator power may be utilized for temporary portable construction trailer(s), construction and/or for commissioning.

### 3.3.7 Lighting System

The lighting system will provide operation and maintenance personnel with illumination in both normal and emergency conditions. Lighting will be designed to provide the minimum illumination needed to achieve safety and security objectives and will be shielded and oriented to focus illumination on the desired areas, minimizing light spillover.

### 3.3.8 Communications Systems

The Project will utilize telephone and internet services that will be provided via overhead or underground lines, microwave tower or via cellular service obtained from a local provider.

### 3.3.9 Employees

The Project would generate construction jobs. The number of workers on the site is expected to vary over the construction period. However, the number of construction workers onsite is expected to average up to 150 workers daily.

### 3.3.10 Security

To ensure the safety of the public and the facility, the property will be fenced, security lighting may be installed, and signs will be posted. Access to the site will be controlled, and gates will be installed at the roads entering the property. The fence will be monitored periodically to detect any intrusion into the property. The Project proposes to construct a chain link fence. Landscaping and entry monumentation will be maintained at the entrance to the Solar Development Area and along Dillard Road.

### 3.3.11 Hours of Operation

Typical construction work hours are expected to be from 6:00 am to 4:00 pm. However, the schedule may change based on a need to comply with various biological mitigation measures, overall construction timing, or worker safety such as avoidance of excessive midday heat. Work at night will be performed occasionally within limited areas of the site.

The facility would be operated remotely through a local solar operations and maintenance company.

## 3.4 Decommissioning Plan

The planned operational life of the facility is 35 years. The Project will be decommissioned in accordance with the Sacramento County approved Decommissioning Plan dated January 2021.

## 3.5 Schedule

Construction would take place over approximately 8 months, beginning May 2023 and ending in December 2023.

INTENTIONALLY LEFT BLANK

---

# 4 Environmental Baseline

To assess the effects of a Proposed Action on federally listed species, the Section 7 implementing regulations require an analysis of how the Proposed Action may affect the environmental baseline (50 CFR 402.02). The environmental baseline provides information that USFWS uses to determine if the Proposed Action is not likely to jeopardize the continued existence of species being considered or result in the destruction or adverse modification of critical habitat. This section characterizes the environmental baseline of the Action Area and surrounding lands. The environmental baseline described below includes the effects of the past and existing uses within the Action Area (including the effects of the existing solar facility that is not part of the Project), and the anticipated impacts of all proposed Federal projects in the Action Area that have already undergone formal or early section 7 consultation.

## 4.1 Study Methods

### 4.1.1 Database and Literature Evaluation

A database and literature evaluation of federally listed special-status biological and aquatic resources present or potentially present within the Action Area. The database and literature evaluation assessed the Action Area vicinity, which specifically includes the general and nearby areas adjacent to the Action Area, not to exceed 5 miles. Resources and search parameters used during the desktop-level review include the following:

- *Aquatic Resources Delineation Report for the Sloughouse Solar Project (SLLC 2022b) (Appendix F; Figure 6). Rancho Seco Solar II Project in Sacramento County, California (U.S. Army Corps of Engineers Sacramento District 2016-00757) (USFWS 2019a).*
- SSHCP (Sacramento County 2018).
- SSHCP USFWS Incidental Take Permit (USFWS 2019b).
- USFWS *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (USFWS 1999).
- USFWS *Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle* (USFWS 2022f).
- *BA prepared for Consultation with the USFWS for the Twin River Transit-Oriented Development and Light Rail Station Project* (City of Sacramento 2016).
- *BA prepared for the California Valley Solar Ranch Project* (HPR II LLC 2010).
- *Biological Technical Report for the Sloughouse Solar Project (SLLC 2022a) (Appendix G).*
- *BA prepared for the Rancho Seco Solar II Project (RSS II LLC 2018), and the BO Formal Consultation on the Rancho Seco Solar II Project in Sacramento County, California (USACE Sacramento District 2016-00757) (USFWS 2019a).*
- USFWS *Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon* (USFWS 2005a).

- USFWS *Survey Guidelines for the Listed Large Branchiopods* (USFWS 2017).
- USFWS dry and wet season protocol survey letter reports for federally listed branchiopods (USFWS#2020-TA-3007) (SLLC 2021a-b) (Appendices D and F; Figures 8 and 9).
- Federal Emergency Management Agency National Flood Hazard Layer geospatial database (FEMA 2022) (Figure 5).
- National Oceanic and Atmospheric Administration Essential Fish Habitat (EFH) West Coast Data Inventory via ArcGIS (NOAA 2022) (Figure 8).
- Natural Resources Conservation Service Web Soil Survey (USDA 2022) (Figure 4).
- USFWS Environmental Conservation Online System Threatened and Endangered Species Active Critical Habitat Reports (USFWS 2022b).
- USFWS IPaC Trust Resource Report for the Action Area (USFWS 2022a) (Appendix A).
- USFWS National Wetlands Inventory Mapper of historical wetland data (USFWS 2022c) (Figure 5).
- USFWS species profiles for vernal pool fairy shrimp and vernal pool tadpole shrimp (USFWS 2022d-e).
- Western Regional Climate Center climate data (WRCC 2022).
- U.S. Geological Survey (USGS) National Hydrography Dataset to assess potential surface water features occurring in the Action Area vicinity (USGS 2022) (Figure 5).

## 4.1.2 Field Studies

The field studies detailed in the sections below are specific to the species assessed within this BA, vernal pool fairy shrimp, vernal pool tadpole shrimp, and valley elderberry longhorn beetle. Additional information pertaining to the federally listed species that have been eliminated from the BA for consultation can be reviewed in the *Biological Technical Report for the Sloughhouse Solar Project* (SLLC 2022a) (Appendix G).

### 4.1.2.1 Aquatic Resources Delineation

On behalf of the Applicant, Dudek conducted an aquatic resources field delineation within the Action Area on October 27, 29, and 30, 2020; November 4 and 9 through 13, 2020; and March 3, 2021. The purpose of the field delineation was to identify aquatic resources that may be potentially subject to agency jurisdiction pursuant to federal and state of California (state) regulations in Section 401 and 404 of the Clean Water Act (CWA), the Porter-Cologne Water Quality Control Act, California Fish and Game Code, California Environmental Quality Act guidelines, and that may provide habitat to federally listed branchiopod species. Aquatic resources within the Action Area were delineated based on methodology described in USACE's *Wetlands Delineation Manual* (USACE 1987) and the *Regional Supplement for the Arid West Region* (USACE 2008a). Non-wetland waters (NWW) of the U.S. and/or state were delineated based on the presence of an ordinary high water mark (OHWM), as determined using the methodology in the *OHWM Field Guide for the Arid West Region* (USACE 2008b). Aquatic resources were recorded

and mapped in the field using a Trimble R1 GNSS Receiver with sub-meter accuracy and ArcGIS Collector app for iOS. On June 9, 2021, the final Aquatic Resources Delineation Report with a formal request for an Approved Jurisdictional Delineation was submitted to USACE, Sacramento District, to definitively determine and approve the extent of waters of the U.S. (Appendix F).

#### 4.1.2.2 Protocol-Level Large Listed Branchiopod Dry Season Surveys

Protocol-level dry season surveys were conducted for large-listed branchiopods (i.e., vernal pool fairy shrimp [*Branchinecta lynchi*] and vernal pool tadpole shrimp [*Lepidurus packardii*]) within the Action Area. The purpose of protocol-level large listed branchiopod dry season surveys is to identify if listed branchiopods are present within aquatic habitat soils that may potentially be subject to agency jurisdiction pursuant to federal and state regulations under FESA, California Endangered Species Act, California Fish and Game Code, and California Environmental Quality Act guidelines. On behalf of the Applicant, surveys were conducted on October 13 through 16, October 19 through 22, and November 11, 2020, by Dudek biologists holding valid USFWS 10(a)(1)(A) Recovery Permits for the listed species. Surveys were conducted in accordance with the *Survey Guidelines for Large Listed Branchiopods* (USFWS 2017) and were approved by USFWS prior to surveying.

For the dry season surveys, soil samples were collected from the bottom of each known aquatic resource when the soil was very dry, and a small 6-inch hand trowel was used to excavate between 10 and 100 samples of soil (approximately 100 milliliters each), depending on the size of the aquatic resource. The locations of the aquatic resources and sampling transects were recorded and mapped in the field using ArcGIS Collector app for iOS. Samples were collected equidistantly along two perpendicular transects. Soil samples were submitted in November 2020 for processing by Helm Biological Consulting to assess for cysts in the soil samples. On February 11, 2021, the *final 90-Day Dry Season Protocol Survey Letter Report for Federally Listed Branchiopods* was submitted to the Sacramento Office of the USFWS. On March 4, 2021, the USFWS provided a formal receipt of all report submittals (Appendix D).

#### 4.1.2.3 Protocol-Level Large Listed Branchiopod Wet Season Surveys

Protocol-level wet season surveys were conducted for large-listed branchiopods (i.e., vernal pool fairy shrimp and vernal pool tadpole shrimp) within the Action Area. The purpose of protocol-level large listed branchiopod wet season surveys is to identify if live listed branchiopods are present within inundated aquatic resources that may be subject to jurisdiction pursuant to state regulations under FESA, California Endangered Species Act, California Fish and Game Code, and California Environmental Quality Act guidelines. Surveys were conducted on February 3–5, February 17–18, March 3–4, March 17–18, March 31, April 14–15, and April 28, 2021, by a Dudek biologist holding a valid USFWS 10(a)(1)(A) Recovery Permit for the species. Surveys were conducted in accordance with the *Survey Guidelines for Large Listed Branchiopods* (USFWS 2017) and were approved by USFWS prior to surveying.

For the wet season surveys, site visits began after initial storm events when potential listed large branchiopod habitat had become inundated. All potential habitat was sampled at 14-day intervals after the initial inundation of habitat. Sampling continued within each potential habitat until it dried. At each wet season visit, representative portions of the bottom, edges, and vertical water column of the features were adequately sampled using a dip net or aquarium net. The contents of the nets were examined and emptied frequently. Information on pool conditions and species was recorded and mapped in the field using ArcGIS Collector app for iOS. The *final 90-Day Wet Season*

*Protocol Survey Letter Report for Federally Listed Branchiopods* was submitted to the Sacramento Office of the USFWS in July 2021. On July 29, 2021, the USFWS provided a formal receipt of all report submittals (Appendix E).

#### 4.1.2.4 Protocol-Level Valley Elderberry Longhorn Beetle Surveys

Dudek conducted focused surveys for valley elderberry longhorn beetle within the Action Area on February 19 and 25, 2021, and January 12, 2022. Surveys were conducted prior to the onset of the typical known emergence period for adult valley elderberry longhorn beetle (i.e., March through June). The purpose of the surveys was to identify habitat and species presence that may be potentially subject to agency jurisdiction. The surveys were performed using the *Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle (Desmocerus californicus dimorphus)* (USFWS 2022f), and the *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (USFWS 1999). The surveys focused on the assessment of black elderberry shrubs (i.e., *Sambucus nigra*), the host plant to valley elderberry longhorn beetle, to evaluate for ancillary evidence of presence including eggs and/or larval galleries, bore holes, and frass. Only elderberry shrubs stem greater than 1 inch diameter at breast height were evaluated. Elderberry shrub health, total number of stems, and proximity to riparian habitat were also recorded during the surveys. Elderberry shrub locations were recorded and mapped in the field using ArcGIS Collector app for iOS.

## 4.2 Environmental Setting

The following section provides information pertaining to the existing physical conditions within the Action Area.

### 4.2.1 Regional Setting and Land Use

The Action Area is located within eastern Sacramento County at the eastern edge of the Central Valley, approximately 15 miles from the western foothills of the Sierra Nevada Mountains (Figure 1). The Action Area is less than 1 mile south of State Route 16, and approximately 18 miles southeast of the City of Sacramento. The Action Area is surrounded by rural residential, commercial development, and open space composed of annual grassland and agricultural fields. The Action Area is primarily used for cattle grazing or other agricultural operations. There is an existing solar facility located in the southeast corner of the Action Area (Figure 2).

### 4.2.2 Climate

The Action Area is in a semi-arid climate where average annual temperatures range from approximately 53°F to 91°F, and the average annual precipitation is 20.06 inches. On average, the months with the highest rainfall are December and January, and July has the least precipitation (WRCC 2022). According to data from the Sacramento WB City weather station, the total precipitation recorded from October 1, 2019, through September 30, 2021, was 17.92 inches, approximately 61% of normal. Therefore, the Action Area region had below normal hydrological conditions in the year preceding the biological resource surveys. The Sacramento WB City weather station is located approximately 18 miles west of the Action Area at an elevation of approximately 25 feet amsl (CDEC 2020).

### 4.2.3 Soil and Terrain

The Action Area is in an area of relatively flat topographic relief with scattered rolling hills. Elevations within the Action Area range from approximately 95 feet amsl in the western portion of the Action Area to 160 feet amsl in the southeastern portion of the Action Area.

According to the Natural Resources Conservation Service, there are 16 soil units mapped within the Action Area. Each soil unit, hydric and drainage class (i.e., frequency and duration of wet periods in conditions like those in which it was developed), and typical landform or geomorphic position within the landscape is detailed in Table 2. Figure 3, Soil and Terrain Setting, provides the geographic extent of each soil unit in the Action Area region (USDA 2022).

Of the 16 soil units identified within the Action Area, six are listed as hydric soils. Hydric soils are defined by the National Technical Committee for Hydric Soils as soils that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part (USDA 2021). Under natural conditions, these soils are either saturated or inundated long enough during the growing season to support the growth and reproduction of hydrophytic vegetation. Refer to Section 4.2.4 for description of wetlands and other waters recorded in the Action Area. Soils encountered during the field surveys were generally classified as clay to clay loam soils. Table 2 below shows the soils occurring within the Action Area.

**Table 2. Summary of Soil Units Within the Action Area**

Soil Map Unit Name	Landform	Drainage Class	Hydric	Total Area within Action Area (acres)
Bruella sandy loam, 0%–2% slopes	Terraces	Well-drained	No	2.44
Bruella sandy loam, 2%–5% slopes	Terraces	Well-drained	No	58.80
Columbia sandy loam, 0%–2% slopes	Flood plains	Somewhat poorly drained, occasionally flooded	Yes	17.93
Galt clay, 0%–1% slopes	Basin floors on fan remnants	Somewhat poorly drained	Yes	33.0
Galt clay, 2%–5% slopes	Basin floors on fan remnants	Moderately well drained	Yes	126.62
Hadselville-Pentz complex, 2%–30% slopes	Hills	Moderately well drained to well drained	No	226.32
Peters clay, 1%–8% slopes	Hills	Well drained	No	56.94
Redding gravelly loam, 0%–8% slopes	Fan remnants	Moderately well drained	No	14.93
Reiff fine sandy loam, 0%–2% slopes	Flood plains	Well drained, occasionally flooded	No	96.11
Sailboat silt loam, drained, 0%–2% slopes	Flood plains on natural levees	Somewhat poorly drained, occasionally flooded	Yes	3.50

**Table 2. Summary of Soil Units Within the Action Area**

Soil Map Unit Name	Landform	Drainage Class	Hydric	Total Area within Action Area (acres)
San Joaquin silt loam, 0%–3% slopes	Terraces	Moderately well drained	No	14.02
San Joaquin silt loam, 0%–8% slopes	Terraces	Moderately well drained	No	52.45
San Joaquin-Durixeralfs complex, 0%–1% slopes	Terraces	Moderately well drained to well drained	No	0.25
San Joaquin-Galt complex, leveled, 0%–1% slopes	Terraces	Moderately well drained	Yes	0.52
San Joaquin-Galt complex, 0%–3% slopes	Terraces	Moderately well drained	Yes	18.59
San Joaquin-Xerarents complex, leveled, 0%–1% slopes	Terraces	Moderately well drained to well drained	No	3.52

Source: USDA 2022.

#### 4.2.4 Hydrology

The Action Area occurs within the Upper Cosumnes River watershed, which drains approximately 180 square miles of land in El Dorado, Amador, and Sacramento Counties (Hydrological Unit Code 1804001306) (USGS 2022). A complex of seasonally inundated aquatic features generally drains the Action Area in a southwesterly direction, and the Cosumnes River flows within the western boundary of the Action Area (Figure 5). The western half of the Action Area is located within the Federal Emergency Management Agency National Flood Hazard Layer 1% 100-year floodplain of the Cosumnes River (FEMA 2022), which flows immediately west of the Action Area. However, the portion of the Cosumnes River within the Action Area is bounded by levees intended to contain the river and protect against overtopping during varied annual precipitation events. The National Wetlands Inventory maps numerous aquatic resources in the Action Area, including Freshwater Emergent Wetland, Freshwater Forested/Shrub Wetland, Freshwater Pond, and Riverine (USFWS 2020c). The National Wetlands Inventory dataset is based on coarse aerial mapping (Figure 5). Table 3 below shows the distribution of aquatic resources within the Action Area.

**Table 3. Summary of Aquatic Resources within the Action Area**

Aquatic Resource Feature	Aquatic Resource Type	Total Acreage
<b>Solar Development Area</b>		
Ditch	NWW	0.15
Ephemeral Drainage	NWW	0.74
Intermittent Drainage	NWW	0.46
Seasonal Wetland Swale	NWW	0.70
Upland Swale	NWW	0.08
Pond	Wetlands	0.37
Seasonal Wetland	Wetlands	3.10

**Table 3. Summary of Aquatic Resources within the Action Area**

Aquatic Resource Feature	Aquatic Resource Type	Total Acreage
Vernal Pool	Wetlands	0.25
	<i>Sub-Total</i>	5.85
<b>Adjacent Other Lands</b>		
Ditch	NWW	1.78
Ephemeral Drainage	NWW	0.37
Intermittent Drainage	NWW	1.91
Perennial Drainage	NWW	24.10
Seasonal Wetland Swale	NWW	1.45
Upland Swale	NWW	0.54
Freshwater Emergent Wetland	Wetlands	0.02
Pond	Wetlands	16.64
Seasonal Wetland	Wetlands	11.06
Vernal Pool	Wetlands	6.04
	<i>Sub-Total</i>	63.90
	<b>Total</b>	<b>69.75</b>

Source: SSSLIC 2022a.

#### 4.2.4.1 Waters

##### Ditch

There are four ditches comprising approximately 1.93 acres (5,105.55 linear feet) throughout the Action Area, of which 0.15 acre (720.26 linear feet) is within the Solar Development Area, and 1.78 acres (4,385.29 linear feet) are within the Adjacent Other Lands of the Action Area (Figure 6). The earthen ditches are human-made features with intermittent hydrology intended for runoff from stormwater, agricultural uses, irrigation, or similar purposes. There is no continuous riparian corridor associated with the ditch features in the Action Area (SSSLIC 2022b) (Appendix F).

##### Ephemeral Drainage

There are four ephemeral drainages comprising approximately 1.11 acres (3,431.84 linear feet) within the Action Area, of which 0.74 acres (2,439.08 linear feet) occur in the Solar Development Area and 0.37 acres (992.76 linear feet) occur in the Adjacent Other Lands (Figure 6). Ephemeral drainages on site consist of stream channels that are naturally occurring rather than human created and contain flowing water during and briefly after precipitation events. Hydrology of the ephemeral drainages depends on inputs during rain events and runoff from the surrounding uplands. There are no continuous riparian corridors associated with these features in the Action Area (SSSLIC 2022b) (Appendix F).

## Freshwater Emergent Wetland

One freshwater emergent wetland comprising approximately 0.02 acres occurs in the southwest corner of the Action Area (Figure 6). This feature entirely occurs within the Adjacent Other Lands within the Action Area. This feature has developed because of artificial irrigation and would likely convert to upland vegetation if the leakage were repaired (SLLC 2022b) (Appendix F).

## Intermittent Drainage

There is one intermittent drainage comprising approximately 2.36 acres (4,462.81 linear feet) within the Action Area, of which 0.46 acres (1,303.60 linear feet) occur in the Solar Development Area and 1.91 acres (3,159.21 linear feet) occur in the Adjacent Other Lands (Figure 6). Intermittent drainages generally have flowing water during certain times of the year, when groundwater provides water for stream flow, and receive supplemental water from rainfall runoff. The intermittent drainage on site appears to receive water via a culvert from a basin complex located north of the Action Area. The drainage receives water from two adjacent seasonal wetland swales, contains three seasonal wetlands within low points or widenings, and terminates into Pond 3 (SLLC 2022b) (Appendix F).

## Perennial Drainage (Cosumnes River)

The northwestern portion of the Action Area contains 24.10 acres (4,506.29 linear feet) of the Cosumnes River and its associated riparian corridor. This feature entirely occurs within the Adjacent Other Lands within the Action Area (Figure 6). The Cosumnes River is a known jurisdictional water with perennial flows that originates in the Sierra Nevada mountains and flows approximately 50 miles into the Central Valley, emptying into the Mokelumne River in the Sacramento San Joaquin Delta (SLLC 2022b) (Appendix F).

## Seasonal Wetland Swale

There are 15 seasonal wetland swales comprising approximately 2.15 acres (8,807.17 linear feet) within the Action Area, of which 0.70 acres (3,874.33 linear feet) occur in the Solar Development Area, and 1.45 acres (4,932.85 linear feet) occur in the Adjacent Other Lands (Figure 6). Seasonal wetland swales on site consist of topographic depressions that would be expected to convey water when inundated, but where a defined bed and bank and typical fluvial indicators are lacking (SLLC 2022b) (Appendix F).

## Upland Swale

There are seven upland swales comprising approximately 0.62 acres (1,837.54 linear feet) within the Action Area, of which 0.08 acres (923.59 linear feet) occur in the Solar Development Area and 816 linear feet 0.54 acres (811.44 linear feet) occur in the Adjacent Other Lands (Figure 6). Upland swales on site consisted of linear topographic depressions that lack a distinct OHWM (SLLC 2022b) (Appendix F).

### 4.2.4.2 Wetlands

#### Seasonal Wetland

There are 51 seasonal wetlands comprising approximately 14.16 acres throughout the Action Area, of which 3.10 acres occur in the Solar Development Area and 11.06 acres occur in the Adjacent Other Lands (Figure 6). These

features only are inundated seasonally, and some are connected via seasonal wetland swales, ephemeral drainages, and/or intermittent drainages. Seasonal wetlands were characterized by a distinct change in vegetation type and cover from the surrounding grassland. Small mammal burrows were observed within several of the features, indicating that these features remained dry for a long enough period for subterranean animals to inhabit them (SLLC 2022b) (Appendix F).

**Pond**

There are three ponds comprising approximately 17.01 acres within the Action Area, of which 0.37 acres occur in the Solar Development Area and 16.64 acres occur in the Adjacent Other Lands (Figure 6). These features are natural closed depressions that have been artificially augmented by perennial water sources, for the purpose of supporting livestock (SLLC 2022b) (Appendix F).

**Vernal Pool**

There are 17 vernal pools comprising approximately 6.30 acres throughout the Action Area, of which 0.25 acres occur in the Solar Development Area and 6.04 acres occur in the Adjacent Other Lands (Figure 6). These features were characterized as three-parameter wetlands with an impermeable layer such as a hard pan that may fill and empty several times during the rainy season. These features may be isolated or connected to larger vernal complexes via swales or subsurface flows. The vernal pools on site exhibited concentric rings of distinctly different vegetation cover and species composition (SLLC 2022b) (Appendix F).

## 4.2.5 Vegetation Communities and Land Cover Types

Vegetation communities and land cover types within the Action Area consist of a combination of terrestrial non-vegetative land covers and natural vegetation communities (Figure 7). The vegetation communities and land covers within the Action Area were mapped using the SSHCP land cover data (Sacramento County 2018). SSHCP vegetation communities and land cover types occurring within the Action Area include agricultural, California annual grassland, low density development, mixed riparian forest, urban, valley foothill riparian, and valley grassland. The SSHCP has also mapped aquatic resource land covers with the Action Area including hydrologic streams and creeks, swales, seasonal wetlands, and vernal pools (Figure 5, Vegetation and Land Cover). The SSCHP aquatic resources within the Action Area have been replaced with the more detailed mapping of aquatic resources as defined in Section 4.2.4. Table 4 below provides a summary of vegetation communities and land cover types within the Action Area.

**Table 4. Summary of Vegetation Communities and Land Cover Types within the Action Area**

Vegetation Community/Land Cover Type	Total Acreage
<b>Solar Development Area</b>	
California Annual Grassland	357.61
Low Density Development	6.84
Urban	1.96
<i>Sub-Total</i>	366.41

**Table 4. Summary of Vegetation Communities and Land Cover Types within the Action Area**

Vegetation Community/Land Cover Type	Total Acreage
<b>Adjacent Other Lands</b>	
Agricultural	85.33
California Annual Grassland	180.48
Low Density Development	14.93
Mixed Riparian Woodland	10.42
Urban	2.32
Valley Foothill Riparian	17.38
Valley Grassland	2.86
<i>Sub-Total</i>	<i>313.71</i>
<b>Total</b>	<b>680.12</b>

**Source:** Sacramento County 2018.

**Note:** The total acreage of vegetation communities land cover types omits overlapping aquatic resources occurring in the Action Area.

#### 4.2.5.1 Vegetation Communities

##### California Annual Grassland

California annual grassland is the dominant vegetation community present through all portions of the Action Area. Dominant species in this community include soft brome (*Bromus hordeaceus*), medusa head (*Elymus caput-medusae*), and narrow tarweed (*Holocarpha virgata*). The shrub and tree layer are absent from this vegetation community. There are numerous aquatic features that occur throughout the California annual grassland (discussed in Section 4.2.4). California annual grassland supports wildlife species such as herbivores, deer, rabbits, gophers, and mice, and provides suitable nesting and foraging bird habitat. California annual grassland comprises a total of 357.61 acres in the Solar Development Area and a total of 180.48 acres in the Adjacent Other Lands of the Action Area.

##### Mixed Riparian Woodland

Mixed riparian woodland is a vegetation community that is present along the Consumes River corridor, on the east side of the Action Area, outside of the Solar Development Area. Mixed riparian woodland intergrades with the valley grassland wooded borders along streams and agricultural fields (Sacramento County 2018). Vegetation associated with this vegetation community includes various oak species (*Quercus* spp.) and elderberry shrubs, as well as other herbaceous species that occur in the sparse to densely vegetated ground cover. There is no mixed riparian woodland within the Solar Development Area. Mixed riparian woodland comprises a total of 10.42 acres with the Adjacent Other Lands of the Action Area.

##### Valley Foothill Riparian

Valley foothill riparian is a vegetation community that is also present along the Cosumnes River corridor. Valley foothill riparian is like the mixed riparian woodland vegetation community. There is no valley foothill riparian within

the Solar Development Area. Valley foothill riparian comprises a total of 17.38 acres with the Adjacent Other Lands of the Action Area.

### Valley Grassland

Valley grassland is present within a ditch adjacent to the agricultural areas in the eastern vicinity of the Action Area. Valley grassland is a vegetation community that is like the California annual grassland vegetation community. Additionally, valley grassland is one of the most dominant vegetation types in the Action Area and in the Action Area region (Sacramento County 2018). This vegetation community is characterized mostly by naturalized annual grasses and herbaceous annual forbs and includes patches with relatively high proportions of native grasses and forbs. There is no valley grassland within the Solar Development Area. Valley grassland comprises a total of 2.86 acres with the Adjacent Other Lands of the Action Area.

## 4.2.5.2 Land Cover Types

### Agricultural

Agricultural land cover comprises a large field to the east of the Cosumnes River riparian corridor and levee. Land cover classified as agricultural typically includes lands where farming and other agricultural practices take place, including pastures (hay and alfalfa), row crops and other unidentified croplands. Production practices observed in the Action Area include flood-irrigation and cultivation followed by harvesting and discing. After discing, some fields remain fallow for short periods of time, allowing for the establishment of annual and biennial native and non-native annual grasses and broad-leaved plants, including many non-native species. In 2018, approximately 500 acres were burned in a fire and no irrigation was initiated. No agricultural land cover was identified in the Solar Development Area of the Action Area. Agricultural land cover comprises a total of 85.33 acres in the Adjacent Other Lands of the Action Area.

### Low Density Development

The low-density development land cover type consists of relatively sparse constructed environments such as residences and other structures, including farm buildings, and small rural neighborhoods with large individual property sizes per house (Sacramento County 2018). These areas are primarily concentrated in the northeastern vicinity of the Action Area, adjacent to agricultural lands. Low density development land cover comprises a total of 6.84 acres in the Solar Development Area and a total of 14.93 acres in the Adjacent Other Lands of the Action Area.

### Urban

The urban land cover type consists of developed areas, including roadways and other general infrastructure systems. Most urban areas, if planted, are planted with non-native grasses, shrubs, and trees. Species composition in urban habitats varies with planting design and climate. Monoculture is commonly observed in tree groves and street tree strips. Some urban land covers are regularly maintained by irrigation, mowing, pruning, or other management techniques (Sacramento County 2018). Urban land cover in the Action Area consists of Sacramento County roads. Urban land cover comprises a total of 1.96 acres in the Solar Development Area and a total of 2.32 acres in the Adjacent Other Lands of the Action Area.

## 4.3 Considered Species Accounts

### 4.3.1 Vernal Pool Fairy Shrimp (*Branchinecta lynchi*)

#### 4.3.1.1 Status and Distribution

Vernal pool fairy shrimp is listed as a threatened species under FESA. In California, the species is found from Shasta County in the north, throughout the Central Valley, and west to the central Coast Ranges, at elevations of 30 to 4,000 feet. Additional populations have been reported from the Agate Desert region of Oregon near Medford. Disjunct populations occur in San Luis Obispo, Santa Barbara, and Riverside Counties. However, most known locations are in the Sacramento and San Joaquin Valleys and along the eastern margin of the central Coast Ranges (Eng et al. 1990).

#### 4.3.1.2 Habitat and Ecology

Vernal pool fairy shrimp inhabit vernal pools that form in depressions, usually in grassland habitats (Eng et al. 1990). Pools must remain inundated long enough for the species to complete its life cycle. The final DCH for these species specifies that vernal pool crustaceans and plants live in vernal pools (shallow depressions that hold water seasonally), swales (shallow drainages that carry water seasonally), and ephemeral (short duration) freshwater habitats. Though some of the habitat characteristics of the species are known, specific pool characteristics that determine suitability for vernal pool fairy shrimp hatching, growth, and reproduction are not well understood. Vernal pool fairy shrimp occurrences are known to occur in eight general areas of concentration on basin rim, low terrace, high terrace, volcanic mudflow, valley floor, alkaline playa, and coastal mountain landforms. Vernal pool fairy shrimp are usually found in vernal pools although they are sometimes found in a range of natural and artificially created ephemeral habitats such as alkali pools, seasonal drainages, stock ponds, vernal swales, and rock outcrops. Vernal pool fairy shrimp are most frequently found in small (<2,125 ft<sup>2</sup> (<200 m<sup>2</sup>)) and shallow (2 in (mean of 5 cm)) pool habitats; however, this species can be found in large (480,967 ft<sup>2</sup> (44,534 m<sup>2</sup>)) and very deep (48 in (122 cm)) pool habitats as well. The DCH primary constituent elements for vernal pool fairy shrimp are the habitat components that provide (USFWS 2005b):

- Topographic features characterized by mounds and swales, and depressions within a matrix of surrounding uplands that result in complexes of continuously, or intermittently, flowing surface water in the swales connecting the pools described below, providing for dispersal, and promoting hydroperiods of adequate length in the pools.
- Depressional features including isolated vernal pools with underlying restrictive soil layers that become inundated during winter rains and that continuously hold water for a minimum of 18 days, in all but the driest years: thereby providing adequate water for incubation, maturation, and reproduction. As these features are inundated on a seasonal basis, they do not promote the development of obligate wetland vegetation habitats typical of permanently flooded emergent wetlands.
- Sources of food, expected to be detritus occurring in the pools, contributed by overland flow from the pools' watershed, or the results of biological processes within the pools themselves, such as single-celled bacteria, algae, and dead organic matter, to provide for feeding.

- Structure within the pools described above, consisting of organic and inorganic materials, such as living and dead plants from plant species adapted to seasonally inundated environments, rocks, and other inorganic debris that may be washed, blown, or otherwise transported into the pools, which provide shelter.

Female vernal pool fairy shrimp carry fertilized eggs in a sac on the underside of their body. The eggs are either dropped to the pool bottom or remain in the brood sac until the mother dies and sinks to the bottom of the pool. When the pool dries out, so do the eggs. Resting fairy shrimp eggs are known as cysts. Cysts may remain viable for multiple years due to their protective coverings that help them withstand extreme environmental conditions and even digestion by predators. The cysts remain in the dry pool bed until hatching begins in response to rains and the return of water in the vernal pools (USFWS 2022d).

The lifespan of the vernal pool fairy shrimp is 91 days on average. Vernal pool fairy shrimp can be found in vernal pools starting in November most years and complete their entire life cycle by early May. On average, vernal pool fairy shrimp take 18 days to mature after hatching and 40 days to reproduce. Multiple cohorts of eggs may hatch in a single vernal pool throughout the wet season, given the right conditions. Vernal pool fairy shrimp disappear before the vernal pools dry (USFWS 2022d).

Vernal pool fairy shrimp are non-migratory and have little ability to disperse on their own. Aquatic birds are the most likely agents of dispersal of vernal pool fairy shrimp. Large mammals are also known to act as distributors by wallowing in dirt, getting cysts caught in their fur and transporting the cysts to another wallow. Additionally, cysts can be ingested, passed through the digestive tract, and then deposited in new habitats when the animal urinates (USFWS 2022d).

### 4.3.1.3 Habitat and Occurrence in the Action Area

Vernal pool fairy shrimp may occur in the vicinity of the Action Area, but this species was not observed during protocol-level dry and wet season surveys. Suitable habitat and SSHCP modeled habitat are present in the Action Area, which includes vernal pools (Sacramento County 2018). There are various DCH units for vernal pool fairy shrimp within 5 miles of the Action Area, with the nearest 1.3 miles southeast of the Action Area (USFWS 2022e). In addition, there are several known occurrences for this species within 5 miles of the PSA, with the nearest being located within 0.25 miles of the PSA on the south side of Meiss Road, approximately 0.75 miles southeast of the intersection at Dillard Road (CDFW 2022). A summary of the protocol-level large listed branchiopod dry and wet season survey results is provided below in Section 4.2.3.

## 4.3.2 Vernal Pool Tadpole Shrimp (*Lepidurus packardii*)

### 4.3.2.1 Status and Distribution

Vernal pool tadpole shrimp is listed as endangered under ESA. Vernal pool tadpole shrimp is a California Central Valley endemic species, with most populations in the Sacramento Valley. This species has also been reported from the Sacramento to the San Joaquin River Delta east of San Francisco Bay and from scattered localities in the San Joaquin Valley from San Joaquin to Madera Counties (USFWS 2022e).

### 4.3.2.2 Habitat and Ecology

Vernal pool tadpole shrimp occur in a wide variety of seasonal habitats, including vernal pools, ponded clay flats, alkaline pools, ephemeral stock tanks, and roadside ditches. This species is typically found at the highest concentrations in playa pools, large deep vernal pools, and winter lakes (larger than 100 acres) but have also been found in small ephemeral pools (smaller than 25 square feet). The species' presence in small pools is believed to be a result of wash down from larger source pools. Vernal pool tadpole shrimp have been observed in a variety of habitats ranging from clear, vegetated vernal pools to highly turbid alkali scalds with variable depths and volumes of water during the wet cycle (USFWS 2022e). The DCH primary constituent elements for vernal pool tadpole shrimp are equal to those for vernal pool fairy shrimp, as detailed above in section 4.2.1.2.

Female vernal pool tadpole shrimp produce up to six clutches of eggs containing 32 to 61 eggs per clutch each wet season. The life span of the vernal pool tadpole shrimp is about 144 days on average. Vernal pool tadpole shrimp can be found in vernal pools starting in November most years and complete their entire life cycle by early May. On average, vernal pool tadpole shrimp take 38 days to mature after hatching and 51 days to reproduce. Multiple cohorts of eggs may hatch in a single vernal pool throughout the wet season given the right conditions. Vernal pool tadpole shrimp disappear before the vernal pools dry (USFWS 2022e).

Vernal pool tadpole shrimp are non-migratory and have little ability to disperse on their own. Aquatic birds are the most likely agents of dispersal of vernal pool tadpole shrimp. Large mammals are also known to function as distributors by wallowing in dirt, getting cysts caught in their fur and transporting the cysts to another wallow. Additionally, cysts can be ingested, passed through the digestive tract, and then deposited in new habitats when the animal urinates (USFWS 2022e).

### 4.3.2.3 Habitat and Occurrence in the Action Area

Vernal pool tadpole shrimp has been documented in the Action Area (Sacramento County 2018) but was not observed during protocol-level dry and wet season surveys of the Action Area during 2020–2021. Suitable habitat and SSHCP modeled habitat are present within the Solar Development Area, including vernal pools (CDFW 2022; Sacramento County 2018). In addition, there are various DCH units for vernal pool tadpole shrimp within 5 miles of the Action Area, with the nearest 1.3 miles southeast of the Action Area (USFWS 2020a). A summary of the protocol-level large listed branchiopod dry and wet season survey results is provided below in Section 4.2.3.

## 4.3.3 Branchiopod Survey Results

### 4.3.3.1 Protocol-Level Dry Season Survey Results

Dry season branchiopod surveys were conducted in October and November 2020 (Table 5). Soil samples were submitted to Dr. Brent Helm at Helm Biological Consulting to process the dry soil samples for the presence of cysts from fairy shrimp and tadpole shrimp. Dry season surveys were negative for federally listed large branchiopods (Figure 9). However, six features contained cysts belonging to the non-listed California fairy shrimp (*Linderiella occidentalis*) (SSLLC 2021a) (Appendix D).

## 4.3.4 Valley Elderberry Longhorn Beetle (*Desmocerus californicus dimorphus*)

### 4.3.4.1 Status and Distribution

Valley elderberry longhorn beetle is a federally threatened species known to occur in the within the region of the Action Area and with a low likelihood to occur within the Action Area. Valley elderberry longhorn beetle is completely dependent on its host plant, elderberry (*Sambucus* spp.), which occurs in riparian and other upland communities in California's Central Valley and the neighboring foothills. Specifically, the range of this species extends from approximately Shasta County in the north to Fresno County in the south including the valley floor and lower foothills. The majority of valley elderberry longhorn beetle have been documented below 500 feet amsl. Areas above 500 feet amsl with suitable habitat and known valley elderberry longhorn beetle occurrences in a drainage may contain valley elderberry longhorn beetle populations in certain circumstances (USFWS 2022f).

#### 4.3.4.2 Habitat and Ecology

Elderberry shrubs are the obligate larval host plants for the valley elderberry longhorn beetle. Elderberry shrubs are common in a variety of riparian and non-riparian vegetative communities. Elderberry shrub presence within the species range is determined by broad scale hydrologic regimes such as the relative elevation of floodplain and floodplain width, and secondarily by sediment texture and topography. Elderberry shrubs are most common on higher and older riparian terraces, where the roots of the plant can reach the water table and where the plants are not inundated for long periods. Elderberry shrubs can be found on historic floodplain terraces above the river, on levees (both on the river and land sides), and along canals, ditches, and areas where subsurface flow provides water to elderberry roots. Elderberry shrubs typically occur in most vegetation communities that occupy historic and current floodplains and terraces, to the top of channel walls in deeply incised rivers, and to the top of and on the landside of levees where woody plants create savannas or patchy woodlands. Elderberry shrubs can be a canopy or subcanopy species depending on the hydrology, vegetation composition, or disturbance at a particular site and it can occur as individual shrubs, clumps, clusters, and groves. In non-riparian settings, elderberry shrubs occur either singly or in groups in valley oak and blue oak woodland and annual grasslands (USFWS 2022f).

Much of the existing research has focused on the valley elderberry longhorn beetle's use of riparian habitat. Research suggests that the valley elderberry longhorn beetle occurs throughout the Central Valley in metapopulation. Metapopulations are defined as a system of discrete subpopulations that may exchange individuals through dispersal or migration. The valley elderberry longhorn beetle metapopulation occurs throughout contiguous intact riparian habitat as subpopulations that shift spatially and temporally within drainages, resulting in a patchwork of occupied and unoccupied habitat. In non-riparian habitats, a patchwork of individual shrubs provides opportunity for valley elderberry longhorn beetle occupancy, but it is unknown if the movement and distribution patterns remain consistent with the patterns found in riparian areas (USFWS 2022).

The valley elderberry longhorn beetle is a small (0.5 to 0.8 inches) wood-boring beetle in the Cerambycid family. It is sexually dimorphic, and the females are indistinguishable from the more widespread California elderberry longhorn beetle (*Desmocerus californicus californicus*). Elderberry shrubs support valley elderberry longhorn beetle and their larvae, which go through several developmental stages within the elderberry shrub. Eggs are laid individually on leaves or at the junctions of the leaf stalk and main stem. Upon hatching, the larvae bore into the elderberry stem and create feeding galleries in the pith. Prior to pupation, the larvae create an exit hole, plugs the hole with wood shavings, and returns to the gallery where it pupates. Approximately 1 month later, the adult beetle emerges from the stem through the previously created exit hole. Adult emergence, mating, and egg-laying, occurs in the spring and summer, specifically March to June, typically coinciding with the elderberry flowering. Under laboratory conditions, adult males typically live 4 to 5 days, while females can live up to 3 weeks. The only identifiable exterior evidence of elderberry use by VELB is the exit hole created by the larvae (USFWS 2022f).

#### 4.3.4.3 Habitat and Occurrence in the Action Area

There is suitable habitat within the Action Area. A total of 13 elderberry shrubs (some multi-stem) occur within the Action Area and are described further in Section 4.3.4.4 below. Specifically, habitat as well as known occurrences for this species are recorded in the western portion of the Adjacent Other Lands within the riparian corridor of the Consumes River (CDFW 2022, USFWS 2022a). Isolated shrubs also occur in the outlying areas of the Action Area uplands, greater than 165 feet from the boundary of the Solar Development Area (Dudek 2022).

#### 4.3.4.4 Valley Elderberry Longhorn Beetle Protocol-Level Survey Results

Dudek conducted focused surveys for valley elderberry longhorn beetle within the Action Area on February 19 and 25, 2021, and January 12, 2022 (Figure 11). Surveys were conducted in accordance with the *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (USFWS 1999) and specifically focused on the assessment of known locations of elderberry shrubs to evaluate for evidence of valley elderberry longhorn beetle. Surveys were conducted prior to the onset of the typical known emergence period for adult valley elderberry longhorn beetle (i.e., March through June).

A total of 13 elderberry shrubs, all identified as *Sambucus nigra*, were assessed within the Action Area. Of these 13 shrubs, three, one of which are multi-stem, occur within the Solar Development Area and/or are within 165 feet (i.e., typical avoidance buffer area) of the Solar Development Area of the Action Area (Figure 11). No valley elderberry longhorn beetle, egg/larval galleries, or frass were observed on any of the shrubs during the surveys (see Table 7 below). Bore and/or exit holes were observed on four of the 13 shrubs, specifically on shrub ID 2, ID 6, ID 8, and ID 12; of which all occur within the Adjacent Other Lands of the Action Area. Shrub ID 2 is in fair condition and located approximately 385 feet from the Cosumnes River riparian habitat. Shrub ID 6 is in poor condition and located in an upland area approximately 1,650 feet from the riparian habitat. Shrub ID 6 is located within the Adjacent Other Lands directly adjacent to the Solar Development Area. Shrub IDs 8 and 12 are both in good condition and are located within 130 and 335 feet of riparian habitat, respectively. The condition of the bore holes observed reflect potential past use of boring insects and are not conclusive to valley elderberry longhorn beetle occupancy. No other elderberry shrub observations relevant to valley elderberry longhorn beetle were made during focused surveys (Dudek 2022).

# 5 Effects Analysis

## 5.1 Definition of Effects

The following section defines the distinct types of effects (i.e., impacts) that the Proposed Action may have on listed species within the Project Action Area.

- **Effects of the action** – all consequences to listed species or critical habitat that are caused by the Proposed Action, including the consequences of other activities that are caused by the Proposed Action (50 C.F.R. § 402.02).
- **Direct effects**- the direct or immediate effects of a Proposed Action on a species or its habitat. Direct effects may result from the Proposed Action and may include the effects of interrelated and interdependent actions. An “interrelated action” is an activity that is part of the Proposed Action, and which depends on the proposed action for its justification. An “interdependent action” is an activity that has no independent utility apart from the action under consultation
- **Indirect effects**- caused by or result from the Proposed Action, are later in time, and are reasonably certain to occur. Indirect effects may also include the effects of interrelated and interdependent actions. Indirect effects may occur outside the area directly affected by the action.
- **Cumulative effects**- comprise the effects of future state, local, and private actions not involving a federal action that are reasonably certain to occur within the Action Area under consideration.
- **No effect**- No effects, positive or negative, to species or habitat from the Proposed Action. No effect does not mean a small effect or an effect that is unlikely to occur. If effects are insignificant (i.e., small) or discountable, a “may affect, but not likely to adversely affect” determination is appropriate. A no effect determination does not require Section 7 consultation with the USFWS.
- **May affect, but not likely to adversely affect**- effects are beneficial, insignificant, or discountable. Beneficial effects have contemporaneous positive effects without any adverse effects on the species or habitat. Insignificant effects relate to the size of the impact and include those effects that are undetectable, not measurable, or cannot be evaluated and should never reach the scale where “take” occurs. Discountable effects are those extremely unlikely to occur. Based on the best scientific and commercial information available, a person would not be able to meaningfully measure, detect, or evaluate insignificant effects, or expect discountable effects to occur. This determination requires written concurrence from the USFWS.
- **May affect and is likely to adversely affect**- listed species or habitat are likely to be exposed to the Proposed Action or its environmental consequences and will respond in a negative manner to the exposure. This determination means that effects on species and habitat: (1) are significant in size and avoidance of “take” cannot be guaranteed, and (2) effects are not discountable (extremely unlikely to occur). A combination of beneficial and adverse effects is still “likely to adversely affect,” even if the net effect is neutral or positive. This determination requires formal consultation with USFWS.

## 5.2 Analysis of Effects

Large-scale solar facilities, such as the Proposed Action, have the potential to alter natural areas and impact sensitive biological resources, including habitats for federally listed wildlife. The Project anticipates the use of a single axis tracker system. The modules will be mounted on piles that are driven directly into the ground, and do not require the use of concrete. Some grading will be necessary to accommodate the engineering tolerances of the racking system, but it will be minimized to the extent practicable and is generally designed to maintain existing flow patterns across the site. Additionally, perennial vegetation will be maintained beneath the array following construction. The Proposed Action is designed to reduce environmental impacts by locating solar facilities outside of habitat for listed species to the extent practicable, and by minimizing direct and indirect effects on listed species. Maintaining the existing grade to the extent practicable, and minimizing impacts to upland (i.e., grassland) and aquatic habitats within the Action Area retains the existing hydrologic functions of the habitat, minimizes wetland habitat loss, minimizes the potential for soil erosion, and prevents wildlife habitat fragmentation.

Potential impacts on federally listed vernal pool fairy shrimp, vernal pool tadpole shrimp, and valley elderberry longhorn beetle were evaluated to determine potential effects on these species and their habitats resulting from the Proposed Action. Impacts resulting from operation and maintenance of the Proposed Action were also assessed. Avoidance and minimization measures (AMMs) are included within the description of the Proposed Action, see Section 3, and are also outlined further in Section 6 below. Species-Specific Effects.

### 5.2.1.1 Vernal Pool Fairy Shrimp and Vernal Pool Tadpole Shrimp

Vernal pool fairy shrimp and vernal pool tadpole shrimp species and their habitat are subject to agency jurisdiction pursuant to regulations under FESA Guidelines.

Vernal pool fairy shrimp are a federally threatened species with a low likelihood to be present within the Solar Development Area of the Action Area. There are known occurrences and DCH for vernal pool fairy shrimp within 5 miles of the Action Area. The nearest DCH for vernal pool fairy shrimp is 1.3 miles southeast of the Action Area (USFWS 2022a). There is no critical habitat designation within the Action Area. There are several known occurrences for vernal pool fairy shrimp within 5 miles of the PSA, with the nearest being located within 0.25 miles of the PSA on the south side of Meiss Road, approximately 0.75 miles southeast of the intersection at Dillard Road (CDFW 2022).

Vernal pool tadpole shrimp are a federally endangered species with recorded known historic occurrences within the Solar Development Area of the Action Area. There are known occurrences and DCH for vernal pool tadpole shrimp within 5 miles of the Action Area. The nearest DCH for vernal pool fairy shrimp is 1.3 miles southeast of the Action Area (USFWS 2022a). There is no critical habitat designation within the Action Area.

For this BA, potential suitable habitat within the Action Area is considered to be wetlands and adjoining features (i.e., freshwater emergent wetlands, vernal pools, seasonal wetlands, pond, and seasonal wetland swales). Within the Action Area there are 69.75 acres of aquatic resources, of which 42.67 acres are suitable aquatic habitat. Within the Solar Development Area of the Action Area 5.84 acres of suitable habitat is present that is subject to an analysis of effects from the Proposed Action (Figure 6; Appendix F). No high (exceptional suitability/quality) quality habitat is present within the Solar Development Area of the Action Area. This includes aquatic resources features ephemeral drainage (0.74 acre), pond (0.38 acre), ditch (0.15 acre), seasonal wetland (3.10 acre), seasonal

wetland swale (0.71 acre), intermittent channel (0.45 acre), upland swale (0.07 acre), and vernal pool (0.25 acre). Of the 5.84 acres, 0.08 acres are permanently impacted, and 3.17 acres are temporarily impacted (direct affect), and 2.59 acres are indirectly affected due to their presence in the Solar Development Area of the Action Area and adjacency to construction. Effects are more thoroughly described in the sections below.

Dudek conducted protocol-level surveys for both dry and wet season large-listed branchiopods within the Action Area. No observation of vernal pool fairy shrimp or vernal pool tadpole shrimp were made during the protocol-level surveys. Note that negative survey findings (i.e., no presence) do not demonstrate species absence (Figures 9 and 10; Appendices D and E).

### Direct Effects

Direct effects on federally listed vernal pool branchiopods could result from the destruction of cysts/eggs and permanent modification of wetlands that alters the suitability of the habitat (i.e., filling of wetland basins, changes in surface or subsurface water flow, or destruction of hardpan).

Based on the Proposed Action, construction of new access roads, and placement of H-piles will result in permanent fill (direct effect) of 0.08 acre of suitable habitat for vernal pool brachiopods within the Solar Development Area of the Action Area. No other permanent fill is anticipated.

Cysts/eggs and mature vernal pool branchiopods could also be destroyed during temporary construction activities (direct effect) during the dry season as vehicles and equipment are necessary within the wetlands while installing the solar infrastructure. It is conservatively assumed that the entire wetland area that will host the solar array infrastructure (the area that will result in the 0.08 acre of permanent fill) would be subject to temporary construction disturbance of 3.17 acres of suitable habitat for vernal pool branchiopods within the Solar Development Area of the Action Area. This is a conservative approach, as in reality temporary construction activities would affect only those wetlands within the direct alignment of the solar support posts. Equipment would be unlikely to impact the entirety of the wetland area during installation activities.

### Indirect Effects

The suitable vernal pool branchiopod habitat (i.e., freshwater emergent wetlands, vernal pools, seasonal wetlands, pond, and seasonal wetland swales) that is within the Solar Development Area of the Action Area to be indirectly affected by the Proposed Action total 2.59 acres. Indirect impacts to Adjacent Other Lands are not anticipated by the Proposed Action.

Indirect effects from shading by the solar panels could render potential suitable wetland habitats unsuitable to support federally listed vernal pool branchiopods in the future. Indirect effects of cover by solar panels could include changes in water temperature, vegetative cover, species composition, hydroperiod due to changes in evapotranspiration rates, and changes in surface flows/runoff patterns. The Proposed Action would result in approximately 77% ground cover by solar panels (291.95 acres), leaving 27% open ground on average as compared to 100% open ground in the existing condition. However, even areas with solar panels will remain in a vegetated state due to the panels being elevated on a racking system. This would allow water flowing off the panels to disperse across the ground beneath the panels, allowing site hydrology to be maintained. Additionally, most of the solar panels will be sited in upland areas that will not provide any sort of shading to wetlands. Because vernal pool fairy

shrimp and vernal pool tadpole shrimp are highly adapted to the specific conditions found in vernal pool systems, it is unknown if they would survive the changes that would result from the wetlands being shaded by solar panels. Cover by panels intercepting precipitation and altering flows, and vegetation management that would occur in the surrounding uplands (e.g., regular mowing) could also have some indirect effects to adjacent aquatic vernal pool brachiopod habitat. Aquatic vernal pool brachiopod habitat that would be subject to indirect shading effects are the same features that could be subject to direct effects from ground disturbance associated with construction of the solar arrays.

### **Interrelated and Interdependent Effects**

The Proposed Action is a stand-alone Project and has independent utility. Therefore, no additional actions that could affect federally listed species vernal pool fairy shrimp and vernal pool tadpole shrimp are required to meet the purpose and need of the Proposed Action.

### **Cumulative Effects**

A FESA analysis must address cumulative effects from any future state or private activities not involving federal activities and which are likely to be implemented within the Action Area. Existing land uses in the vicinity of the Action Area are unlikely to change given the agricultural zoning and existing conservation easements. These areas are likely to remain in agricultural practice and open space. Therefore, the Proposed Action is not expected to contribute to additional cumulative effects on federally listed vernal pool brachiopods in the Action Area.

Furthermore, in relation to potential cumulative effects of the SSHCP Plan Area, listed brachiopod habitat (i.e., land cover type) within the Action Area comprises a small percentage of the inventory of those lands in the SSHCP Preserve Planning Unit 5 and an even smaller percentage of the modeled habitat in the SSHCP Plan Area. Specifically, the Proposed Action impacts an extremely small percentage of the SSCHP listed species habitat in SSHCP Preserve Planning Unit 5. During the 30-year life of the Project, approximately 0.001% of the inventory of seasonal wetlands, and less than 2.02% of swales, and 1.04% of vernal pools in Planning Unit 5 would not be available for acquisition by the South Sacramento Conservation Agency. However, on and off-site mitigation for the Proposed Action, which would be equivalent to the relevant AMMs in the SSHCP, are included in the Project compensatory mitigation plan (see Section 6 below).

### **Summary of Effects for Vernal Pool Fairy Shrimp and Vernal Pool Tadpole Shrimp**

Based on the analysis of effects detailed above, the Proposed Action would indirectly, and directly affect the potential suitable habitat for federally listed vernal pool fairy shrimp and vernal pool tadpole shrimp within the Solar Development Area of the Action Area; therefore, the Project may affect and is likely to adversely affect the listed species. A summary of impacts by resources type have been provided below in Table 7. There are no interrelated, independent, and/or cumulative impacts by the Proposed Action. Measures to avoid, minimize, and mitigate affects to jurisdictional wetlands and waters that provide potential listed brachiopod habitat are provided in section 6 of this BA.

**Table 8. Summary of Impacts on Federally Listed Branchiopod Suitable Habitat within the Solar Development Area of the Action Area**

Aquatic Resource Type	Indirect Impact (acres)	Direct Impact (acres)		Totals (acres)
		Temporary	Permanent	
Ephemeral drainage	0.64	0.08	0.02	0.74
Intermittent channel	0.45	0.004	0	0.45
Pond	0.37	0.005	0	0.38
Roadside ditch	0.15	0	0.001	0.15
Seasonal wetland	0.44	2.63	0.03	3.10
Seasonal wetland swale	0.43	0.24	0.04	0.71
Upland Swale	0.04	0.03	0.002	0.07
Vernal pool	0.07	0.18	0.001	0.25
<b>Total (acres)</b>	<b>2.59</b>	<b>3.17</b>	<b>0.08</b>	<b>5.84</b>

**Notes:** Suitable habitat for federally listed branchiopods excludes the following aquatic resources from this analysis: intermittent drainage, perennial drainage, and upland swale.

### 5.2.1.2 Valley Elderberry Longhorn Beetle

Valley elderberry longhorn beetle and the elderberry shrub habitat (i.e., the species host plant) are subject to agency jurisdiction pursuant to regulations under FESA Guidelines.

Valley elderberry longhorn beetle is a federally threatened species with a low likelihood to be present within the Solar Development Area of the Action Area. There is suitable habitat within the Action Area. A total of 13 elderberry shrubs, some multi-stem, occur within the Action Area and are described further in Section 4.3.4.4 above. Specifically, habitat as well as known occurrences for this species are recorded in the Action Area in the western portion of the Adjacent Other Lands within the riparian corridor of the Consumes River (CDFW 2022, USFWS 2022a). Isolated shrubs also occur in the upland locations of the Action Area (Dudek 2022). There is no critical habitat designation within the Action Area for valley elderberry longhorn beetle.

For this BA, suitable habitat within the Action Area is considered to be elderberry shrubs that are within the riparian corridor (i.e., the Consumes River). Suitable habitat within the Action Area is considered to be elderberry shrubs located within uplands (i.e., grasslands), specifically those that are within 2,256 feet (USFWS 2022f) of the riparian corridor.

Dudek conducted protocol-level surveys for valley elderberry longhorn beetle within the Action Area. No observations were recorded during the protocol-level surveys. Note that negative survey findings (i.e., no presence) does not demonstrate species absence (Figures 11).

#### Direct Effects

Direct effects on federally listed valley elderberry longhorn beetle could result from the removal, trimming, herbicides, dust, and erosion to elderberry shrubs. Direct impacts to elderberry shrubs can occur either at a habitat scale (i.e., shrubs located within the Consumes River Corridor of the Action Area), or at an individual shrub scale (i.e., isolated shrubs located within the uplands of the Action Area). Activities that reduce the suitability of an area

for elderberry plants or elderberry recruitment and increase fragmentation may also have impacts to mating, foraging, and dispersal of valley elderberry longhorn beetle.

The USFWS states that “If the project site is non-riparian and contains elderberry shrubs, we use exit hole surveys to evaluate the site for potential occupancy. Exit hole surveys are not essential in riparian areas but may be conducted to assess the level and significance of adverse effects. The presence of exit holes in a shrub increases the likelihood that the shrub is occupied by valley elderberry longhorn beetle; however, a lack of exit holes does not preclude occupancy by the valley elderberry longhorn beetle. In the absence of exit holes, we recommend that a biologist evaluate the project area using the following criteria: (1) Is there a riparian area, elderberry shrubs, or known VELB records within 2,526 feet of the proposed project; and (2) Isolated, non-riparian elderberry clumps are less likely to be occupied or become colonized by VELB and those beyond 2,526 feet from the nearest elderberry clump become increasingly less likely to be occupied. Therefore, a qualified biologist can assess the distance of the elderberry shrub from the nearest riparian area, elderberry shrub, and known occupied elderberry location” (USFWS 2022f).

Based on the Proposed Action, three elderberry shrubs (i.e., shrub ID 4, 6, and 13), one of which is multi stem, occur within the Solar Development Area and/or within 165 feet of the Action Area (USFWS 2022f). Of these shrubs, none documented exit holes, frass, or beetle observations during surveys. All these shrubs reside in the uplands (i.e., non-riparian areas) of the Action Area, with shrub ID 4 being 4,200 feet outside of the riparian corridor, shrub ID 6 being 1,650 feet outside of the riparian corridor, and shrub ID 13 being 4,300 feet outside the riparian corridor. Therefore, two of the of shrubs within the Solar Development Area of the Action Area are greater than 2,256 feet from a riparian corridor, are isolated individuals, and did not have recordable observations of valley elderberry longhorn beetle at the time of surveys.

The Proposed Action will remove shrub ID 4 and shrub ID 13 during construction activities. Therefore, the Project will have direct effects on two of the host plants for valley elderberry longhorn beetle. Shrub ID 6 will be avoided and a USFWS 165 foot buffer will be established to avoid direct effects and will therefore have “no effect”.

### Indirect Effects

In addition to the three elderberry shrubs detailed in the direct impacts section above, 10 additional elderberry shrubs were mapped and surveyed within the Action Area. These 10 additional shrubs occur within the Adjacent Other Lands of the Action Area. Construction activities associated with the Proposed Action will not remove, trim, or transplant any of the shrubs within the Adjacent Other Lands of the Action Area. No fragmentation of riparian habitat will occur within the Action Area, and isolated non-riparian elderberry shrubs will remain undisturbed with a 165-foot avoidance buffer installed during construction activities as needed. Additionally, conservation measures, as noted in Section 6 below, will be employed through the duration of the Proposed Action. Based on this understanding, there are no indirect effects anticipated by the Proposed Action on the remaining 10 elderberry shrubs and valley elderberry longhorn beetle.

### Interrelated and Interdependent Effects

The Proposed Action is a stand-alone Project and has independent utility. Therefore, no additional actions that could affect federally listed valley elderberry longhorn beetle are required to meet the purpose and need of the Proposed Action.

## Cumulative Effects

A FESA analysis must address cumulative effects from any future state or private activities not involving federal activities and which are likely to be implemented within the Action Area. Existing land uses in the Action Area are unlikely to change given the agricultural zoning and existing conservation easements. These areas are likely to remain in agricultural practice and open space. Further, existing and /or future agricultural activities within the Action Area will not result in cumulative adverse effects by the Proposed Action because future agricultural activities within the Action Area will remain consistent with the environmental baseline and will not change. Therefore, the Proposed Action is not expected to contribute to additional cumulative effects on federally listed valley elderberry longhorn beetle in the Action Area.

Furthermore, in relation to potential cumulative effects of the SSHCP Plan Area, valley elderberry longhorn beetle habitat (i.e., land cover type) is not present within the Solar Development Area of the Action Area. Therefore, the Proposed Action will not cumulatively affect the overarching goals and objectives of the SSHCP.

## Summary of Effects for Valley Elderberry Longhorn Beetle

Based on the analysis of effects detailed above, the potential effects from the Proposed Action to valley elderberry longhorn beetle “may affect, but not likely to adversely affect” valley elderberry longhorn beetle. Conservation Measures to avoid adverse effects to direct impacts are provided in section 6 of this BA. There are no interrelated, independent, and/or cumulative impacts of the Proposed Action.

INTENTIONALLY LEFT BLANK

---

## 6 Conservation Measures

The following conservation measures are proposed to avoid and minimize effects on federally listed vernal pool fairy shrimp, vernal pool tadpole shrimp, valley elderberry longhorn beetle, and their habitat. By adhering to these avoidance and minimization measures, the Proposed Action will reduce the potential direct and indirect impacts to these species. To ensure their implementation, these measures would be included as conditions of any permits granted and would be included in the Project specifications.

### 6.1 SSHCP Consistency

The SSHCP streamlines federal and state permitting processes for SSHCP-covered development and infrastructure projects, while protecting habitat, open space, and agricultural lands (SSHCP 2021). The SSHCP is led by a multi-jurisdiction collaborative that includes Sacramento County, the Cities of Rancho Cordova and Galt, the Sacramento County Water Agency, the Sacramento Regional County Sanitation District, and the Capital Southeast Connector Joint Powers Authority (SSHCP 2021). The SSHCP does not expressly include utility-scale solar as a potential covered activity.

The Proposed Action is required to obtain permits and approvals from the USFWS, USACE, CDFW, and RWQCB, and will further minimize and mitigate impacts on natural resources. The USFWS applied the regulatory standards of these and other environmental agencies in their review and approval of the SSHCP. Therefore, the Project mitigation strategy is designed to achieve the mitigation standards applicable to covered activities under the SSHCP. Therefore, for this Project, a SSHCP Consistency Analysis (Appendix H) was prepared for the Project as a supplement to the final Biological Technical Report (Appendix G). The purpose of this consistency analysis is to provide an in-depth evaluation of the Project's consistency with the SSHCP. Mitigation for the Project includes mitigation measures that are equivalent to the relevant AMMs in the SSHCP. These AMMs, coupled with compensatory mitigation for unavoidable impacts, would ensure that Project effects on SSHCP Covered Species would be avoided, minimized, and mitigated so that the Project is consistent with the SSHCP.

### 6.2 Avoidance and Minimization Measures

The significance criteria used to evaluate effects to biological and aquatic resources is based on federal, state, and local regulatory guidance pertaining to potential jurisdictional resources and features occurring only within the Solar Development Area of the Action Area. Applicant proposed AMMs include those measures that would avoid, minimize, or otherwise mitigate potential direct and indirect effects, as detailed in section 5 above, to federally listed vernal pool fairy shrimp, vernal pool tadpole shrimp, and their habitat.

The following assumptions were used in assessing the magnitude of possible impacts on federally listed species.

- All construction staging (including vehicle parking), storage, and access areas would be restricted to the Solar Development Area within the Action Area.
- Construction traffic will be directed along access roads until they reach the point where active work is occurring to limit soil compaction and disturbance to the site.

- Grading will be completed to maintain the overall site drainage patterns that currently exist across the Action Area.
- Driving of equipment through jurisdictional aquatic resources where impacts are unavoidable will be limited to the dry season only for temporary construction impacts. Impacts to Adjacent Other Lands of the Action Area will be avoided, which consists of avoidance to the Cosumnes River and associated riparian corridor.
- The Proposed Action will utilize best management practices as established via NEPA, CEQA, and other permits and permissions necessary for construction of the Proposed Action.

### **AMM-01: Worker Environmental Awareness Training**

The Applicant shall assign a qualified biologist to conduct a Worker Environmental Awareness Program (WEAP). The WEAP should be prepared to educate staff on the presence of special-status species, habitats, and protected wetlands with potential to occur, or that are known to occur, within the Action Area. The program should describe their identification, habitat requirements, and penalties for species impacts, as well as immediate steps to take should special-status plant species be observed by staff on site. This WEAP should include biological resource requirements provided in agency permits or agreements, and any species-specific plans. The WEAP can be provided in the form of a handout and/or video presentation. Staff that attend the training should fill out a sign-in sheet indicating that they completed the training.

### **AMM-02: Environmentally Sensitive Area Exclusions**

The applicant has agreed to containing all construction and operation activities within the Solar Development Area. The periphery of the Solar Development Area will be clearly delineated so that no work occurs in Adjacent Other Lands. Buffers for aquatic resources and elderberry shrubs will be employed. For aquatic resource buffers that may be indirectly impacted within the Solar Development Area, they will be returned to pre-existing conditions the maximum extent practicable. Specifically, flagging, fencing (silt fence, orange safety barrier fence, or equivalent) shall be installed for these buffer areas. All direct construction activities are prohibited within this buffer area unless approval is received to encroach on the buffer via formal consultation with USFWS. Additionally, the applicant has designed the Proposed Action to avoid impacts of the to the maximum extent feasible. The Applicant shall install fencing, stakes/flagging, or other appropriate barriers (e.g., chain-link fence) between the active Solar Development Area and the Adjacent Other Lands to prevent inadvertent encroachment into sensitive habitat areas. The contractor will be responsible for maintaining the fence or other demarcation during construction and ensuring that no construction personnel, equipment, or runoff or sediment from the construction area enters environmentally sensitive areas. If total avoidance is achieved, no further action is required.

### **AMM-03: Construction Monitoring**

The Applicant shall assign a qualified biologist to conduct periodic monitoring (e.g., a minimum of once per week) during construction activities that involve ground disturbance (e.g., vegetation removal, grading, road construction) within the non-developed portions of the Solar Development Area within the Action Area. The purpose of the construction monitoring is to verify that AMMs are properly implemented to protect sensitive resources and that the Project complies with all applicable permit requirements and agency conditions of approval. The biologist will

inspect the barrier fencing (from AMM-02) and any required exclusion fencing around environmentally sensitive areas regularly and will communicate any issues to the construction manager or construction manager's delegate.

#### **AMM-04: Maintain Hydrology**

To avoid indirect effects on wetland hydrology outside the Solar Development Area, the Applicant shall ensure the Project is designed to maintain existing drainage patterns as they exit the Action Area so there is no reduction or increase in existing surface water flow offsite into adjacent habitat.

#### **AMM-05: Aquatic Resources Avoidance**

The Proposed Action will be designed to eliminate and reduce direct and indirect impacts to aquatic resources (i.e., federally listed branchiopod habitat) to the maximum extent possible. For direct and/or indirect impacts that cannot be avoided, the Applicant shall propose a compensatory mitigation framework, as detailed in section 6.3 below, to ensure no net loss of species or habitat.

## **6.3 Compensatory Mitigation**

The following Applicant proposed approach for compensatory mitigation summarizes the proposed biological and aquatic resource mitigation for potential direct and indirect impacts to aquatic resources (i.e., potential habitat for vernal pool fairy shrimp and vernal pool tadpole shrimp) and elderberry shrubs (potential habitat for valley elderberry longhorn beetle) from the Proposed Action (Appendix C).

### **6.3.1 Mitigation for Vernal Pool Fairy Shrimp and Vernal Pool Tadpole Shrimp**

For this compensatory mitigation approach, the Applicant assumes presence/occupancy of vernal pool fairy shrimp and vernal pool tadpole shrimp within the Action Area. Therefore, the mitigation ratio's proposed reflect assumed occupancy of the aquatic resources that provide suitable habitat for these species.

For resources within the Adjacent Other Lands of the Action Area, the Applicant assumes "no effect" through avoidance and implementation of AMMs.

For resources within the Solar Development Area of the Action Area that "may affect, but not likely to adversely affect" or that "may affect, and likely to adversely affect," the Applicant proposes mitigation that will utilize a 2:1 ratio for indirect impacts, a 1:1 ratio for direct temporary impacts, and a 3:1 ratio for direct permanent impacts. Given these ratios, the total direct and indirect impacts would require a total of 8.63 acres of mitigation, as detailed in Table 9 below.

Compensatory mitigation will utilize onsite habitat preservation and/or mitigation/preservation credit purchase from existing in-lieu fee programs or banks. The Project site is within the service area for the Sacramento District California In-Lieu Fee Program the following existing banks: Clay Station Mitigation Bank, Bryte Ranch Conservation Bank, Laguna Creek Mitigation Bank, and Van Vleck Ranch Mitigation Bank. The biological and aquatic resource values of the Adjacent Other Lands within the Action Area, outside the Solar Development Area of the Project, are described in the Biological Resources Compensatory Mitigation Plan, which provides documentation of suitability for compensatory mitigation (SLLC 2022e).

**Table 9. Compensatory Mitigation for Federally Listed Branchiopods Suitable Habitat within the Solar Development Area of the Action Area**

Aquatic Resource Type	Indirect		Direct- Temporary		Direct- Permanent		Total Mitigation (Acreage)
	Impact (acres)	Mitigation 2:1	Impact (acres)	Mitigation 1:1	Impact (acres)	Mitigation 3:1	
Ephemeral drainage	0.64	1.28	0.08	0.08	0.02	0.06	1.42
Intermittent channel	0.45	0.9	0.004	0.004	0	0	0.90
Pond	0.37	0.74	0.005	0.005	0	0	0.75
Roadside ditch	0.15	0.3	0	0	0.001	0.003	0.30
Seasonal wetland	0.44	0.88	2.63	2.63	0.03	0.09	3.60
Seasonal wetland swale	0.43	0.86	0.24	0.24	0.04	0.12	1.22
Upland swale	0.04	0.08	0.03	0.03	0.002	0.006	0.12
Vernal pool	0.07	0.14	0.18	0.18	0.001	0.003	0.32
<b>Total (acres)</b>	<b>2.59</b>	<b>5.18</b>	<b>3.17</b>	<b>3.17</b>	<b>0.08</b>	<b>0.28</b>	<b>8.63</b>

### 6.3.2 Mitigation for Valley Elderberry Longhorn Beetle

For this compensatory mitigation approach, the Applicant does not exclude the presence or absence of Valley Elderberry Longhorn Beetle within the Action Area. The mitigation ratio's proposed reflect recommendations detailed by the USFWS for non-riparian uplands that are greater than 2,256 feet from the Consumes River Riparian Corridor (USFWS 2022f). For resources within the Adjacent Other Lands of the Action Area, the Applicant assumes "no effect" through avoidance and implementation of AMMs.

For resources within the Solar Development Area of the Action Area that "may affect, but not likely to adversely affect" (i.e., direct impacts) the Applicant proposes mitigation that will utilize a 1:1 ratio. Compensatory mitigation will utilize onsite habitat preservation and/or mitigation/preservation credit purchase from existing in-lieu fee programs or banks. The Project site is within the service area for the Sacramento District California In-Lieu Fee Program the following existing banks: Clay Station Mitigation Bank, Bryte Ranch Conservation Bank, Laguna Creek Mitigation Bank, and Van Vleck Ranch Mitigation Bank. The biological resource values of the Adjacent Other Lands within the Action Area, outside the Solar Development Area of the Project, are described in the Biological Resources Compensatory Mitigation Plan, which provides documentation of suitability for compensatory mitigation (SSLLC 2022e).

---

## 7 Conclusion and Determination

In accordance with Section 7 of the FESA, this BA identifies the potential effects of the Proposed Action on considered species, vernal pool fairy shrimp, vernal pool tadpole shrimp, and valley elderberry longhorn beetle, within the Action Area, which is comprised of the Solar Development Area and surrounding vicinity called the Adjacent Other Lands.

No federally listed branchiopods were observed during protocol-level surveys conducted in the wet and dry seasons. During pre-application meetings, the USFWS indicated that based on the known occurrences and location of DCH in the region for these species, they would like to see additional seasons of protocol level surveys or would apply a assumed presence determination if those surveys could not be conducted in the timeframe consistent with the Proposed Action milestones. Therefore, for the purpose of this BA, it is assumed that suitable aquatic habitat (i.e., freshwater emergent wetlands, vernal pools, seasonal wetlands, pond, and seasonal wetland swales) for vernal pool fairy shrimp and vernal pool tadpole shrimp is present in the Action Area. The resources within the Adjacent Other Lands portion of the Action Area will be avoided and AMMs will be applied to reduce impacts to vernal pool fairy shrimp and vernal pool tadpole shrimp. The aquatic resources within the Solar Development Area of the Action Area will be impacted as follows- a total of 2.59 acres would be indirectly impacted, 3.17 acres would direct temporarily be impacted, and 0.08 would be direct permanently impacted. The Applicant proposes mitigation that will utilize a 2:1 ratio for indirect impacts, a 1:1 ratio for direct temporary impacts, and a 3:1 ratio for direct permanent impacts. Given these ratios, the total direct and indirect impacts would require a total of 8.63 acres of mitigation.

In addition, no valley elderberry longhorn beetles were observed on the 13 elderberry shrubs identified within the Action Area. For this BA, two elderberry shrubs have the potential for direct impacts; however, are noted as not containing observations of valley elderberry longhorn beetle, are over 2,256 feet from a riparian corridor (i.e., located in non-riparian uplands). Due to their location and proximity to a riparian corridor, direct removal of these two shrubs will not be defined as fragmentation of habitat suitable for valley elderberry longhorn beetle. Transplantation for direct effects is not recommended for elderberry plants within the Action Area due to the unlikelihood of survival. As such, direct impacts will be mitigated at a 1:1 ratio and secured in accordance with the *Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle (Desmocerus californicus dimorphus)* (USFWS 2022f) and the *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (USFWS 1999).

In summary, the following determinations have been made for the considered species:

- Vernal pool fairy shrimp- may affect and is likely to adversely affect the listed species.
- Vernal pool tadpole shrimp- May affect and is likely to adversely affect the listed species.
- Valley elderberry longhorn beetle- may affect, but not likely to adversely affect the listed species.

Project Name: Sloughhouse Solar Project

July 13, 2022

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

### To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)

(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

<http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF>

**Migratory Birds:** In addition to responsibilities to protect threatened and endangered species under the Endangered Species Act (ESA), there are additional responsibilities under the Migratory Bird Treaty Act (MBTA) and the Bald and Golden Eagle Protection Act (BGEPA) to protect native birds from project-related impacts. Any activity, intentional or unintentional, resulting in take of migratory birds, including eagles, is prohibited unless otherwise permitted by the U.S. Fish and Wildlife Service (50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)). For more information regarding these Acts see <https://www.fws.gov/birds/policies-and-regulations.php>.

The MBTA has no provision for allowing take of migratory birds that may be unintentionally killed or injured by otherwise lawful activities. It is the responsibility of the project proponent to comply with these Acts by identifying potential impacts to migratory birds and eagles within applicable NEPA documents (when there is a federal nexus) or a Bird/Eagle Conservation Plan (when there is no federal nexus). Proponents should implement conservation measures to avoid or minimize the production of project-related stressors or minimize the exposure of birds and their resources to the project-related stressors. For more information on avian stressors and recommended conservation measures see <https://www.fws.gov/birds/bird-enthusiasts/threats-to-birds.php>.

In addition to MBTA and BGEPA, Executive Order 13186: *Responsibilities of Federal Agencies to Protect Migratory Birds*, obligates all Federal agencies that engage in or authorize activities that might affect migratory birds, to minimize those effects and encourage conservation measures that will improve bird populations. Executive Order 13186 provides for the protection of both migratory birds and migratory bird habitat. For information regarding the implementation of Executive Order 13186, please visit <https://www.fws.gov/birds/policies-and-regulations/executive-orders/e0-13186.php>.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Code in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Approximate location of the project can be viewed in Google Maps: <https://www.google.com/maps/@38.4734833,-121.18399345831887,14z>

Counties: Sacramento County, California

---

## Endangered Species Act Species

There is a total of 12 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries<sup>1</sup>, as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

- 
1. [NOAA Fisheries](#), also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

### Reptiles

NAME	STATUS
Giant Garter Snake <i>Thamnophis gigas</i> No critical habitat has been designated for this species. Species profile: <a href="https://ecos.fws.gov/ecp/species/4482">https://ecos.fws.gov/ecp/species/4482</a>	Threatened

### Amphibians

NAME	STATUS
California Tiger Salamander <i>Ambystoma californiense</i> Population: U.S.A. (Central CA DPS) There is <b>final</b> critical habitat for this species. The location of the critical habitat is not available. Species profile: <a href="https://ecos.fws.gov/ecp/species/2076">https://ecos.fws.gov/ecp/species/2076</a>	Threatened

### Fishes

NAME	STATUS
Delta Smelt <i>Hypomesus transpacificus</i> There is <b>final</b> critical habitat for this species. The location of the critical habitat is not available. Species profile: <a href="https://ecos.fws.gov/ecp/species/321">https://ecos.fws.gov/ecp/species/321</a>	Threatened

---

## Insects

NAME	STATUS
Monarch Butterfly <i>Danaus plexippus</i> No critical habitat has been designated for this species. Species profile: <a href="https://ecos.fws.gov/ecp/species/9743">https://ecos.fws.gov/ecp/species/9743</a>	Candidate
Valley Elderberry Longhorn Beetle <i>Desmocerus californicus dimorphus</i> There is <b>final</b> critical habitat for this species. The location of the critical habitat is not available. Species profile: <a href="https://ecos.fws.gov/ecp/species/7850">https://ecos.fws.gov/ecp/species/7850</a>	Threatened

## Crustaceans

NAME	STATUS
Conservancy Fairy Shrimp <i>Branchinecta conservatio</i> There is <b>final</b> critical habitat for this species. The location of the critical habitat is not available. Species profile: <a href="https://ecos.fws.gov/ecp/species/8246">https://ecos.fws.gov/ecp/species/8246</a>	Endangered
Vernal Pool Fairy Shrimp <i>Branchinecta lynchi</i> There is <b>final</b> critical habitat for this species. Your location overlaps the critical habitat. Species profile: <a href="https://ecos.fws.gov/ecp/species/498">https://ecos.fws.gov/ecp/species/498</a>	Threatened
Vernal Pool Tadpole Shrimp <i>Lepidurus packardii</i> There is <b>final</b> critical habitat for this species. Your location overlaps the critical habitat. Species profile: <a href="https://ecos.fws.gov/ecp/species/2246">https://ecos.fws.gov/ecp/species/2246</a>	Endangered

## Flowering Plants

NAME	STATUS
Ione (incl. Irish Hill) Buckwheat <i>Eriogonum apricum (incl. var. prostratum)</i> No critical habitat has been designated for this species. Species profile: <a href="https://ecos.fws.gov/ecp/species/8301">https://ecos.fws.gov/ecp/species/8301</a>	Endangered
Ione Manzanita <i>Arctostaphylos myrtifolia</i> No critical habitat has been designated for this species. Species profile: <a href="https://ecos.fws.gov/ecp/species/1806">https://ecos.fws.gov/ecp/species/1806</a>	Threatened
Sacramento Orcutt Grass <i>Orcuttia viscida</i> There is <b>final</b> critical habitat for this species. Your location overlaps the critical habitat. Species profile: <a href="https://ecos.fws.gov/ecp/species/5507">https://ecos.fws.gov/ecp/species/5507</a>	Endangered
Slender Orcutt Grass <i>Orcuttia tenuis</i> There is <b>final</b> critical habitat for this species. Your location overlaps the critical habitat. Species profile: <a href="https://ecos.fws.gov/ecp/species/1063">https://ecos.fws.gov/ecp/species/1063</a>	Threatened

## Critical habitats

There are 4 critical habitats wholly or partially within your project area under this office's jurisdiction.

NAME	STATUS
Sacramento Orcutt Grass <i>Orcuttia viscida</i> <a href="https://ecos.fws.gov/ecp/species/5507#crithab">https://ecos.fws.gov/ecp/species/5507#crithab</a>	Final

## Biological and Aquatic Resource Compensatory Mitigation Plan

## MEMORANDUM

---

**To:** Alison Little, Associate Planner- Sacramento Planning and Environmental Review; Dylan Wood, Environmental Scientist- California Department of Fish and Wildlife (CDFW); Shawn Agarawal, Environmental Scientist- Central Valley Regional Water Quality Control Board (RWQCB); Matt Hirkala, Project Manager- Sacramento District U.S. Army Corps of Engineers (USACE); Emma Bickerstaff, Project Manager- U.S. Fish and Wildlife Service (USFWS)

**From:** David Hochart and Morgan Kennedy - Dudek

**cc:** Daniel Menahem - Sloughhouse Solar, LLC

**Subject:** Preliminary Biological and Aquatic Resource Compensatory Mitigation Plan, Sloughhouse Solar Project

**Date:** September 21, 2022

**Attachment(s):** 1) Figure 1, Potential Offsite Compensatory Mitigation Lands – Biological Resources

---

This Memorandum (Memo) provides the Preliminary Biological and Aquatic Resource Compensatory Mitigation Plan (Plan) for the Sloughhouse Solar Project (Project) and supplements the *Final Biological Technical Report (BTR) for the Sloughhouse Solar Project* (Dudek 2022) by describing additional details on the proposed biological and aquatic resource compensatory mitigation approach to mitigate potential impacts from the Project.

## 1 Introduction

### 1.1 Project Overview

The Project is a solar photovoltaic energy-generating facility located on the southwest corner of Meiss Road and Dillard Road, adjacent to an existing solar energy facility (Dillard Road Solar Power Facility) located at 7794 Dillard Road, Sloughhouse, Sacramento County, California. The Project would construct, operate, and decommission a solar generation and energy storage facility within a Solar Development Area of approximately 371.72 acres. The Solar Development Area, or the limits of disturbance, is inclusive of solar fields, energy storage, substation[s], roads, retention basins, and all other Project infrastructure. The design and construction of the buildings, solar arrays (panels, etc.), energy storage facilities, and auxiliary facilities will be consistent with Sacramento County building standards.

## 1.2 Project Location

The approximately 732.26-acre Project Study Area (PSA), which is comprised of a Solar Development Area (371.72 acres) and Adjacent Other Lands (360.54 acres), is located at the southwest corner of the intersection of Meiss Road and Dillard Road in Sloughouse, an unincorporated area in eastern Sacramento County. The southeast portion of the PSA is comprised of an existing solar facility (Dillard Road Solar Power Facility). The remainder of the PSA is largely comprised of vacant lands used for cattle ranching. The PSA is surrounded by rural residences, specifically Simpson Ranch to the south, an existing solar facility (Dillard Road Solar Power Facility) a caviar aquaculture farm to the north, orchards, and a turkey farm to the east, and the Cosumnes River to the west. The PSA can be accessed from gates off both Dillard Road and Meiss Road.

## 2 Compensatory Mitigation Approach

The following summary of the proposed biological and aquatic resource compensatory mitigation approach is based on Project information provided in the *Final BTR for the Sloughouse Solar Project* (Dudek 2022) and is intended to supplement the Final BTR by providing additional mitigation details. The Project is in the process of obtaining all regulatory permits necessary for construction and operation, and the Project final BTR is part of the documentation developed to support those approvals. Through the permitting processes, Sacramento County (County) and the regulatory agencies may identify mitigation measures and permit conditions to achieve permitting standards that supersede or supplement the Final BTR measures, and the approach proposed within this Plan at this time, and if so, those additional measures or conditions would be anticipated to strengthen the biological resource avoidance, minimization, and mitigation (AMMs) beyond that described below.

The Project Final BTR provides comprehensive analysis of the biological and aquatic resources in the PSA and recommends a set of AMMs for resources that occur or have the potential to occur. Additionally, as noted above, the County and regulatory agencies may require additional conditions of approval or permit conditions that provide additional resource avoidance and minimization.

The following provides a summary of the potential impacts to special-status species and species habitats based on the Project Amended BTR.

- **Special-Status Plant Species:** No special-status plant species were observed during protocol-level botanical field surveys. Eight special-status plant species have a moderate potential to occur within the Solar Development Area of the PSA and could be impacted absent AMMs. These species include Boggs Lake hedge-hyssop (*Gratiola heterosepala*), dwarf downingia (*Downingia pusilla*), hoary navarretia (*Navarretia eriocephala*), legenere (*Legenere limosa*), pincushion navarretia (*Navarretia myersii* ssp. *myersii*), Sacramento Orcutt grass (*Orcuttia viscida*), slender Orcutt grass (*Orcuttia tenuis*), and valley brodiaea (*Brodiaea rosea* ssp. *vallicola*).
- **Sensitive Natural Communities:** No CDFW sensitive natural communities were identified within the Solar Development Area of the PSA and no impacts would occur. Vernal pool habitat is present within the Solar Development Area (see aquatic resources below).
- **Aquatic Resources:** Permanent impacts to waters of the U.S. and waters of the State under USACE, RWQCB, and CDFW jurisdiction in the Solar Development Area is 0.08 acre. Temporary impacts to waters of the U.S. and waters of the State under USACE, RWCB, and CDFW jurisdiction in the Solar Development Area is 3.17

acres. Indirect impacts to waters of the U.S. and waters of the State under USACE, RWCB, and CDFW jurisdiction in the solar development is 2.59.

- **Designated Critical Habitat (DCH)/Essential Fish Habitat (EFH):** No USFWS DCH or National Oceanic and Atmospheric Administration EFH was identified within the Solar Development Area of the PSA and no impacts would occur.
- **Special-Status Wildlife Species:** Seven special-status wildlife species have known occurrences within the Solar Development Area of the PSA and could be impacted absent AMMs: bald eagle, western burrowing owl (*Athene cunicularia*), Swainson's hawk (*Buteo swainsoni*), tricolored blackbird (*Agelaius tricolor*), white-tailed kite (*Elanus leucurus*), great egret (*Ardea alba*), great blue heron (*Ardea Herodias*), yellow-billed magpie (*Pica nuttalli*), valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*), California linderiella, and vernal pool tadpole shrimp (*Lepidurus packardii*). Other special-status wildlife species with a moderate or high potential to occur based on potential suitable habitat in the Solar Development Area of the PSA include northwestern pond turtle (*Actinemys marmorata*), western spadefoot toad (*Spea hammondi*), American badger (*Taxidea taxus*), Ricksecker's water scavenger beetle (*Hydrochara rickseckeri*), mid-valley fairy shrimp (*Branchinecta mesovallensis*), native bats, and other nesting raptors and migratory birds. Although not detected during protocol surveys and considered to have a low potential to occur in the Solar Development Area of the PSA, AMMs have also been included for California tiger salamander (*Ambystoma californiense*) and vernal pool fairy shrimp (*Branchinecta lynchi*).
- **Protected Tree Species:** 15 individual trees, two of which are dead, are located within the Solar Development Area of the PSA and may be directly impacted by Project activities. No trees will require a Sacramento County Tree Removal Permit, as none of the trees fall within the Sacramento County Tree Preservation Ordinance requirements.

Compensatory mitigation for Project impacts to aquatic resources and specific special-status species will focus on onsite habitat preservation (within the Adjacent Other Lands of the PSA, which are outside the Solar Development Area). If necessary, compensatory mitigation may also be provided through the purchase of credits from an existing in-lieu fee program, and/or conservation/mitigation banks, and/or offsite habitat acquisition and preservation that meet the criteria established during the California Environmental Quality Act (CEQA), NEPA (National Environmental Policy Act), and regulatory permitting process. Any onsite habitat preservation and/or offsite acquisition and preservation lands used for compensatory mitigation would require legal protections (e.g., conservation easement, restrictive covenant, or other approved mechanism), funding for long-term habitat management and monitoring, and preparation of a Preserve Management Plan that describes the preserved biological and aquatic resources, responsible parties, management goals and objectives, management and monitoring activities, and reporting requirements. Funding for onsite preservation lands, or lands acquired and preserved offsite, will be estimated through preparation of a Property Analysis Record (PAR), or PAR-Equivalent Analysis, which is an itemized cost estimate of the initial and capital period costs and annual, ongoing costs.

Table 1, Preliminary Biological and Aquatic Resources Compensatory Mitigation Program for the Potential Impacts Resulting from the Sloughhouse Solar Project, provides the proposed compensatory mitigation program for the potential impacts to special-status biological and aquatic resources for the Sloughhouse Solar Project. As detailed in Table 1, the Project compensatory mitigation program proposes to provide the following compensatory mitigation:

- **Aquatic Resources and Potential Habitat for Large, Listed Branchiopods (i.e., vernal pool fairy shrimp and vernal pool tadpole shrimp):** Compensatory mitigation at the ratios and acreages listed in Table 1 and Table 2 through onsite habitat preservation and/or mitigation/preservation credit purchase from existing in-lieu

fee programs or banks. The Project site is within the service area for the Sacramento District California In-Lieu Fee Program the following existing banks: Clay Station Mitigation Bank, Bryte Ranch Conservation Bank, Laguna Creek Mitigation Bank, and Van Vleck Ranch Mitigation Bank.

- **Swainson’s Hawk, Burrowing Owl, Tricolored Blackbird, and White-Tailed Kite Foraging Habitat:** Compensatory mitigation at the ratios and acreages listed in Table 1 through one or more of the following options: onsite preservation, preservation credit purchase from existing banks, and/or offsite acquisition and preservation of lands from willing sellers. Compensatory mitigation for Swainson’s hawk and burrowing owl foraging habitat likely to benefit other species as described in Table 1.
- **Valley Elderberry Longhorn Beetle Shrub Replacement:** Compensatory mitigation for the lost elderberry shrubs (*Sambucus* sp.) at the ratios listed in Table 1 consistent with existing U.S. Fish and Wildlife Service (USFWS) guidance.

All temporary impacts to potential habitat within the Project Solar Development Area will be restored to pre-Project conditions following Project construction. The biological and aquatic resource values of the Adjacent Other Lands within the PSA, outside the Solar Development Area of the Project, are described in the Final BTR and provides documentation of suitability for compensatory mitigation. The biological and aquatic resources in the potential offsite compensatory mitigation lands are shown in the attached Figure 1, Potential Offsite Compensatory Mitigation Lands - Biological and Aquatic Resources. The attached reports (Estep 2016; Estep 2019) provide details of the habitat suitability, abundance, and distribution of Swainson’s hawk for the potential offsite compensatory mitigation lands (i.e., Van Vleck Ranch). Tricolored blackbird has known occurrences, and Swainson’s hawk and burrowing owl have known occurrences within the immediate vicinity of the potential offsite compensatory mitigation lands based on regional databases. Additionally as shown in the attached Figure 1, the potential offsite mitigation lands are located within the same South Sacramento Habitat Conservation Plan (SSHCP) Preserve Planning Unit (PPU) as the Project (i.e., PPU 5), and the available portions (i.e., outside the portion of the lands in Existing Preserve) of the offsite lands contain SSHCP modeled suitable habitat for the following species: American badger (1,623 acres), burrowing owl (1,786 acres), California tiger salamander (88 acres aquatic; 1,872 acres upland), Swainson’s hawk (11 acres nesting; 1,815 acres foraging), tricolored blackbird (1,571 acres foraging/nesting; 362 acres foraging), Valley elderberry longhorn beetle (11 acres), vernal pool fairy shrimp and vernal pool tadpole shrimp (585 acres), western pond turtle (66 acres aquatic; 1,509 upland), western spadefoot toad (189 acres breeding/foraging; 1,872 acres foraging/aestivation), western red bat (411 acres roosting/foraging; 1,689 acres foraging), and white-tailed kite (350 acres nesting; 1,876 acres foraging) (County of Sacramento et al. 2018).

		If considered unoccupied: 1:1	
<b>Special-Status Wildlife Species</b>			
California tiger salamander	No impacts to individuals with AMMs	Not applicable	Not applicable
	Potential aquatic habitat:	Not applicable	Not applicable
	No impacts to occupied or suitable aquatic habitat		
	Potential upland habitat: Permanent: 15.07 acres Temporary: 287.37 acres	Not applicable	Compensatory mitigation for potential upland habitat impacts is not considered necessary. All temporary impacts to potential habitat will be restored to pre-Project conditions following Project construction. Compensation provided for valley grasslands (see Swainson’s hawk below) have the potential to benefit this species
western spadefoot toad	No impacts to individuals with AMMs	Not applicable	Not applicable

**Table 1. Preliminary Biological and Aquatic Resources Compensatory Mitigation Program for the Potential Impacts Resulting from the Sloughouse Solar Project**

Special-Status Resource	Impact Type and Impact Acreage	Mitigation Ratio <sup>1</sup>	Compensatory Mitigation
	Potential aquatic habitat:  No impacts to occupied aquatic habitat. See impacts to aquatic resources above for impacts to suitable aquatic habitat	Not applicable	Compensatory mitigation for suitable aquatic habitat for species is not considered necessary. Compensation provided for aquatic resources (see aquatic resources above) has the potential to benefit this species
	Potential upland habitat:  Permanent: 15.07 acres Temporary: 287.37 acres	Not applicable	Compensatory mitigation for potential upland habitat is not considered necessary. All temporary impacts to potential habitat will be restored to pre-Project conditions following Project construction. Compensation provided for valley grasslands (see Swainson’s hawk below) have the potential to benefit this species
northwestern pond turtle	No impacts to individuals with AMMs	Not applicable	Not applicable
	Potential aquatic habitat:  No impacts to occupied or suitable aquatic habitat	Not applicable	Not applicable
	Potential upland habitat:  Permanent: 15.07 acres Temporary: 287.37 acres	Not applicable	Compensatory mitigation for potential upland habitat is not considered necessary. All temporary impacts to potential habitat will be restored to pre-Project conditions following Project construction. Compensation provided for valley grasslands (see Swainson’s hawk below) have the potential to benefit this species
western burrowing owl	No impacts to nesting or non-nesting individuals with AMMs	Not applicable	Not applicable
	Potential nesting, wintering, and/or foraging habitat:  Permanent: 15.07 acres Temporary: 287.37 acres	See Swainson’s hawk below	All temporary impacts to potential habitat will be restored to pre-Project conditions following Project construction. Compensation provided for valley grasslands (see Swainson’s hawk below) will also provide suitable habitat to offset impacts to western burrowing owl

**Table 1. Preliminary Biological and Aquatic Resources Compensatory Mitigation Program for the Potential Impacts Resulting from the Sloughouse Solar Project**

Special-Status Resource	Impact Type and Impact Acreage	Mitigation Ratio <sup>1</sup>	Compensatory Mitigation
Swainson's hawk	No impacts to nesting individuals with AMMs	Not applicable	Not applicable
	Foraging habitat:  Permanent: 15.07 acres, Temporary: 287.37 acres  Solar Development Area includes 357.61 acres of valley grassland habitat suitable for foraging. 78.75 acres would likely be unavailable for foraging beneath solar arrays; 278.86 acres would remain available as foraging habitat	1:1 restoration of temporary impacts onsite  1:1 compensatory mitigation for potentially lost foraging acreage <sup>6</sup>	All temporary impacts to potential habitat will be restored to pre-Project conditions following Project construction. 78.75 acres of compensatory mitigation for potentially lost foraging acreage <sup>6</sup> . Fulfill through preservation onsite, grassland restoration and management to promote foraging, mitigation/preservation bank credit purchase <sup>5</sup> , or offsite acquisition and preservation from willing seller. Compensatory mitigation acreage should provide suitable foraging habitat for Swainson's hawk, western burrowing owl, tricolored blackbird, and white-tailed kite. The biological resources onsite and outside the Solar Development Area (as documented in the Final BTR) and/or on the potential offsite mitigation land (shown in the attached Figure 1 and attached reports) would fulfill this compensatory mitigation
tricolored blackbird	No impacts to nesting individuals or colonies with AMMs	Not applicable	Not applicable
	Potential foraging habitat:  Permanent: 15.07 acres Temporary: 287.37 acres	See Swainson's hawk above	All temporary impacts to potential habitat will be restored to pre-Project conditions following Project construction. Compensation provided for valley grasslands (see Swainson's hawk above) will also provide suitable habitat to offset impacts to tricolored blackbird
white-tailed kite	No impacts to nesting individuals or colonies with AMMs	Not applicable	Not applicable
	Potential foraging habitat:  Permanent: 15.07 acres Temporary: 287.37 acres	See Swainson's hawk above	All temporary impacts to potential habitat will be restored to pre-Project conditions following Project construction. Compensation provided for valley grasslands (see Swainson's hawk above) will also provide suitable habitat to offset impacts to white-tailed kite

	Potential upland habitat:  Permanent: 15.07 acres Temporary: 287.37 acres	Not applicable	Compensatory mitigation for potential American badger habitat is not considered necessary. All temporary impacts to potential habitat will be restored to pre-project conditions following Project construction. Compensation provided for valley grasslands (see Swainson’s hawk above) has the potential to benefit this species
native bats	No impacts to roosting individuals or maternity colonies with AMMs	Not applicable	Not applicable
	Potential foraging habitat:  Permanent: 15.07 acres Temporary: 287.37 acres	Not applicable	Compensatory mitigation for potential bat foraging habitat is not considered necessary. All temporary impacts to potential habitat will be restored to pre-Project conditions following Project construction. Compensation provided for valley grasslands (see Swainson’s hawk above) have the potential to benefit these species

**Table 1. Preliminary Biological and Aquatic Resources Compensatory Mitigation Program for the Potential Impacts Resulting from the Sloughhouse Solar Project**

Special-Status Resource	Impact Type and Impact Acreage	Mitigation Ratio <sup>1</sup>	Compensatory Mitigation
nesting raptors and migratory birds	No impacts to nesting individuals with AMMs	Not applicable	NA
	Potential nesting and foraging habitat:  Permanent: 15.07 acres Temporary: 287.37 acres	Not applicable	Compensatory mitigation for potential nesting and foraging habitat is not considered necessary. All temporary impacts to potential habitat will be restored to pre-Project conditions following Project construction. Compensation provided for valley grasslands (see Swainson’s hawk above) have the potential to benefit these species

**Notes:**

- <sup>1</sup> Mitigation ratio is the ratio (compensation acreage to impact acreage) assumed to be required by the Sacramento County (County) and/or regulatory agencies to calculate the required compensatory mitigation acreage. Mitigation ratios and the resources requiring compensatory mitigation subject to change based discussions with the County and regulatory agencies to achieve applicable regulatory and permitting standards.
- <sup>2</sup> AMMs include additional pre-activity botanical surveys according to standard guidelines. If special-status plant species are detected at that time, avoidance measures will be implemented. If avoidance is not possible, a Botanical Mitigation Plan will be prepared to compensate for the unavoidable impacts to achieve applicable California Endangered Species Act (CESA) and Federal Endangered Species Act (FESA) permitting standards.
- <sup>3</sup> Special-status species with a moderate potential to occur in Solar Development Area: Boggs Lake hedge-hyssop, dwarf downingia, hoary navarretia, legenera, pincushion navarretia, Sacramento Orcutt grass, slender Orcutt grass, and valley brodiaea
- <sup>4</sup> Aquatic resource impacts and mitigation are separated into the regulatory agencies with jurisdiction. Compensatory mitigation may be the same for all regulatory agencies if they meet the applicable permitting requirements of each agency. Mitigation ratios, compensatory mitigation acreage, and proposed mitigation approach subject to approval from the County and regulatory agencies. Aquatic resources have the potential to provide habitat for large, listed Branchiopod species (i.e., vernal pool fairy shrimp and vernal pool tadpole shrimp). This Plan assumes the regulatory agencies will consider the aquatic resources to be occupied by these species (despite the negative protocol-level wet and dry season survey results).
- <sup>5</sup> The Project site is within the service area for the following existing in-lieu fee program and banks: Sacramento District California In-Lieu Fee Program, Clay Station Mitigation Bank, Bryte Ranch Conservation Bank, Laguna Creek Mitigation Bank, and Van Vleck Ranch Mitigation Bank.
- <sup>6</sup> The Project proposes to compensate for potential lost foraging acreage beneath solar arrays; however, most of this acreage (i.e., areas not permanently impacted by project components) would likely continue to provide habitat and refuge for Swainson’s hawk prey species following construction of the Project. See attached report on Swainson’s hawk foraging use of solar array fields within agricultural landscapes in Sacramento County (Estep 2021).

**Subject:** *U.S. Fish and Wildlife Service Dry Season Protocol Survey Letter Report for Federally Listed Branchiopods, Sloughhouse Solar Project, Sacramento County, California (USFWS#2020-TA-3007)*

Dear Ms. Lantz and Mr. Perkins-Taylor:

This U.S. Fish and Wildlife Service (USFWS) Dry Season Protocol Survey Letter Report (Report) for federally listed branchiopods has been prepared in accordance with the USFWS *Survey Guidelines for the Listed Large Branchiopods*<sup>1</sup> and to fulfill reporting requirements in accordance with the 10(a)(1)(A) permit holders recovery permits. . This Report provides a complete overview of the dry season surveys conducted for the Sloughhouse Solar Project (Project). If you have any questions regarding this Report, or need any additional information, please feel free to call or email me at (916) 661-2498, mkennedy@dudek.com.

Sincerely,

Morgan Kennedy

Environmental Compliance Manager, Ecologist

# 1 Introduction

This Report documents the results of the dry season surveys for vernal pool branchiopods conducted within the Project Study Area (PSA) located in south eastern Sacramento County, California. Surveys focused on the determination of presence/no presence for the federally threatened vernal pool fairy shrimp (*Branchinecta lynchi*) and federally endangered vernal pool tadpole shrimp (*Lepidurus packardii*). Surveys were performed in accordance with the protocols listed above. No dry season surveys have been previously conducted as part of the Project.

The request to conduct dry season surveys was submitted to the USFWS on September 28, 2020 and approved by the USFWS on September 29, 2020 (Attachment A). Dry season surveys were conducted over nine total days within the PSA in October and November 2020. Dry season surveys were led and performed by Section 10(a)(1)(A) permitted Dudek biologists Heather Moine (TE-60147A-1) and Paul Lemons (TE-051248-6). Each permitted biologist was supported by Dudek biologists with appropriate field experience including Laura Burris, Anna Godinho, Emily Scricca, and Allie Sennett. Soil samples were submitted to Dr. Brent Helm at Helm Biological Consulting<sup>2</sup> (HBC) to process the dry soil samples for the presence of cysts from fairy shrimp and tadpole shrimp and to culture cysts to identify to species-level, as permitted as a special condition in the 10(a)(1)(A) permit held by HBC (Attachment B). A summary of dry season survey dates, PSA environmental conditions, and biologists conducted the surveys is provided in Table 1 below.

**Table 1. Summary of Dry Season Survey Dates, Site Conditions, and Biologists Present**

Date of Survey	Site Conditions	Permitted Biologist	Assisting Biologists
October 13, 2020	66–90 °F; 0–10% cloud cover; 0–6 mph wind	Heather Moine <sup>a</sup>	Allie Sennett
October 14, 2020	62–91 °F; 0% cloud cover; 1–7 mph wind	Heather Moine	Allie Sennett
October 15, 2020	57–90 °F; 0% cloud cover; 0–5 mph wind	Heather Moine	Emily Scricca
October 19, 2020	55–89 °F; 0% cloud cover; 0–4 mph wind	Heather Moine	Laura Burris
October 20, 2020	54–88 °F; 0% cloud cover; 0–4 mph wind	Heather Moine, Paul Lemons <sup>b</sup>	Laura Burris, Anna Godinho, Emily Scricca, and Allie Sennett
October 21, 2020	54–88 °F; 0% cloud cover; 0–4 mph wind	Heather Moine, Paul Lemons	Laura Burris, Anna Godinho, Emily Scricca, and Allie Sennett
October 22, 2020	56–78 °F; 0% cloud cover; 0–6 mph wind	Heather Moine	Anna Godinho, Allie Sennett
October 23, 2020	45–59 °F; 0% cloud cover; 0–3 mph wind	Heather Moine	Anna Godinho
November 11, 2020	42–58 °F; 80–90% cloud cover; 0–4 mph wind	Heather Moine	Anna Godinho, Allie Sennett

## 2 Project Setting

### 2.1 Location

The approximately 741.20-acre PSA is located at the southwest corner of the intersection of Meiss Road and Dillard Road in the unincorporated community of Sloughhouse within south eastern Sacramento County. The PSA excludes existing solar facilities within the site. The PSA is primarily used for cattle grazing or other agricultural operations, and there is an existing solar facility located in the southeast corner of the site (Attachment C). Project location details are detailed as follows:

- County: Sacramento.
- Public Land Survey System: Cosumnes Land Grant.
- U.S. Geological Survey (USGS) 7.5-Minute Quadrangle (Quad): Sloughhouse.
- Latitude, Longitude: 38.473731, -121.184568 (centroid, decimal degrees).
- Assessor Parcel Numbers (APNs): 12601100010000, 12601100030000.
- Elevation Range: 95 to 160 feet above mean sea level (amsl).
- Average Elevation: 128 feet amsl.
- PSA: 741.20 acres.

### 2.2 Soils

According to the Natural Resources Conservation Service<sup>3</sup>, 16 soil units are present within the PSA (Attachment D). Each soil unit, typical landform or geomorphic position within the landscape, drainage class (i.e., frequency and duration of wet periods in conditions similar to those in which it was developed), hydric listing, and total area is detailed in Table 2 below.

**Table 2. Summary of Soil Units Within the Project Study Area (PSA)**

Soil Map Unit Name	Landform	Drainage Class	Hydric?	Total Area (acres)
Bruella sandy loam, 0-2% slopes	Terraces	Well-drained	No	27.11
Bruella sandy loam, 2-5% slopes	Terraces	Well-drained	No	34.84
Columbia sandy loam, drained, 0-2% slopes, occasionally flooded	Flood plains	Somewhat poorly drained	Yes	17.93

<sup>3</sup> USDA (U.S. Department of Agriculture). 2021. "Web Soil Survey". USDA, Natural Resources Conservation Service, Soil Survey Staff. Accessed February 2021. <https://websoilsurvey.sc.egov.usda.gov/App/WebSoilSurvey.aspx>.

**Table 2. Summary of Soil Units Within the Project Study Area (PSA)**

Soil Map Unit Name	Landform	Drainage Class	Hydric?	Total Area (acres)
Galt clay, 0–1% slopes, MLRA 17	Basin floors on fan remnants	Somewhat poorly drained	Yes	33.0
Galt clay, 0–4% slopes, MLRA 17	Basin floors on fan remnants	Moderately well drained	Yes	126.62
Hadselville-Pentz complex, 2–30% slopes	Hills	Moderately well drained to well drained	No	231.74
Peters clay, 1–8% slopes	Hills	Well drained	No	56.94
Redding gravelly loam, 0–8% slopes, MLRA 17	Fan remnants	Moderately well drained	No	15.29
Reiff fine sandy loam, 0–2% slopes, occasionally flooded	Flood plains	Well drained	No	96.11
Sailboat silt loam, drained, 0–2% slopes, occasionally flooded, MLRA 17	Flood plains on natural levees	Somewhat poorly drained	Yes	3.50
San Joaquin silt loam, 0–3% slopes	Terraces	Moderately well drained	No	14.02
San Joaquin silt loam, 3–8% slopes	Terraces	Moderately well drained	No	54.45
San Joaquin-Durixeralfs complex, 0–1% slopes	Terraces	Moderately well drained to well drained	No	0.25
San Joaquin-Galt complex, leveled, 0–1% slopes	Terraces	Moderately well drained	Yes	2.83
San Joaquin-Galt complex, 0–3% slopes	Terraces	Moderately well drained	Yes	17.35
San Joaquin-Xerarents complex, leveled, 0–1% slopes	Terraces	Moderately well drained to well drained	No	6.32

### 2.3 Watershed and Hydrology

The PSA is located within the Upper Cosumnes River watershed, which drains approximately 180 square miles of land in El Dorado, Amador, and Sacramento Counties (Hydrological Unit Code 1804001306<sup>4</sup>. A complex of seasonally inundated aquatic features generally drains the Project in a southwesterly direction, and the Cosumnes River flows within the western boundary of PSA. The western half of the PSA is located within the National Flood Hazard Layer 1% 100-year floodplain of the Cosumnes River<sup>5</sup>. However, the Cosumnes River within the PSA is bounded by levees intended to contain the river and protect against overtopping during a normal rain year (Attachment E).

## 2.4 Vegetation Communities and Land Cover

General vegetation communities and land cover types were documented within the PSA during the dry season surveys (Attachment F) and include the following:

- Agricultural/ (Low Density) Developed/ Urban- This land cover type includes areas that have been completely altered by human activities and contain little to no vegetation or a composite of agricultural cover crops and escaped cultivars. Such areas include buildings, paved and gravel roadways and trails, gravel lots, and other constructed environments. Disturbed/developed areas on the PSA include two residences along Meiss Road.
- California Annual Grassland- This is the dominant vegetation community present in the PSA. Dominant species in this community include soft brome (*Bromus hordeaceus*), medusa head (*Elymus caput-medusae*), and narrow tarweed (*Holocarpha virgata*). The shrub and tree layer are absent from this vegetation community. There are numerous aquatic features that occur throughout the grassland.
- Valley Oak Woodland- This general vegetation community specifically includes a composite mixed riparian woodland and valley foothill riparian. Valley oak woodland comprises the riparian corridor adjacent to the Cosumnes River, a portion of which is located within the PSA. Valley oak (*Quercus lobata*) was the dominant overstory species, with a lesser abundance of Fremont's cottonwood (*Populus fremontii*), Goodding's black willow (*Salix gooddingii*), Northern California walnut (*Juglans hindsii*), and coast live oak (*Quercus agrifolia*). Shrubs occurred intermittently and included Himalayan blackberry (*Rubus armeniacus*) and California grape (*Vitis californica*). The herbaceous layer was dominated by disturbance-tolerant upland species, including yellow star-thistle (*Centaurea solstitialis*), Italian plumeless thistle (*Carduus pycnocephalus*), and non-native grasses like those described for California annual grassland.

## 3 Methodology

### 3.1 Field Survey and Soil Collection

For the dry season surveys, soil samples were collected from the bottom of each known aquatic resource when the soil was very dry, and a small 6-inch hand trowel was used to excavate between ten samples (approximately 100 milliliter each) and 100 samples (approximately 100 milliliter each) of soil. Samples were collected equidistantly along two generally perpendicular transects (lengthwise [transect A] and widthwise [transect B]), incorporating the deepest regions of the aquatic feature, and thoroughly sampling the aquatic feature surface area. Immediately after sample collection, the soil was carefully placed into plastic sample bag and labeled according to aquatic feature, transect, and position. Sample bags from each aquatic feature were then placed into a larger bag for organization.

### 3.2 Soil Processing

Soil samples were collected from the aquatic features and submitted in November 2020 for processing by HBC, authorized USFWS Recovery Permit number TE-795930-10.2 of Section 10(a)(1)(A) of the Federal Endangered

Species Act, 16 U.S.C. 1531 et seq., and its implementing regulations. At the HBC laboratory, a brine solution was prepared by mixing table salt (NaCl) with lukewarm tap water in a large container. The collected soil material was placed in the brine solution. The soil material was then gently worked by hand to breakdown any persistent soil structure. The organic material rising to the top of the brine solution was skimmed off and placed in a 600-micron diameter pore-size sieve stacked atop a 75-micron diameter pore-size sieve. The soil material was processed through the top sieve by flushing it with lukewarm tap water while gently rubbing it with a soft-bristle brush. The soil retained from the 75-micron diameter pore size sieve was then removed and thinly ( $\approx 1.0$  millimeter) spread into plastic petri dishes and examined.

### 3.3 Cyst Culturing

The contents of each petri dish were examined under a 10 to 252-power zoom binocular microscope. A minimum of 30 minutes was spent searching the contents of each petri dish for large branchiopod cysts (embryonic eggs). HBC’s large branchiopod cyst collection and scanning electron micrographs of cysts were used to identify and compare any cysts observed within the soil samples. This processing method (described above) favors the detection of cysts belonging to the genera *Branchinecta*, *Lepidurus*, and *Streptocephalus* since these three genera have species that are federally listed. Evidence of other aquatic macroinvertebrates encountered were also noted on the laboratory datasheet. Please view the attached dry season report by HBC for more detailed information regarding dry season soil analysis (Attachment B).

## 4 Results

Soil samples were collected from a total of 67 aquatic resource features (Attachment G). All soil samples were collected by Dudek and processed and analyzed by HBC for evidence of large branchiopods. No evidence of federally listed large branchiopods (i.e., cysts belonging to the genus *Branchinecta* or *Lepidurus* or carapaces of *Lepidurus*) were observed in the soils collected. However, cysts belonging to the non-listed California fairy shrimp (*Linderiella occidentalis*) were observed in the soils collected from six features (ID-01, P-02, SW-17, SW-18, SWS-07, and VP-15). A complete summary of results has been provided in Table 3 below. Additionally, photo plates of the PSA and various aquatic features samples have been provided (Attachment H).

<sup>a</sup> Abundance categories are derived from USFWS’s Survey Guidelines for the Listed Large Branchiopods - Section VI(d) (none = no cysts found in sample; low abundance = estimate of 1-10 cysts/100 milliliter soil; medium abundance = estimate of 11-50 cysts/100 milliliter soil; high abundance = estimate of more than 50 cysts/100 milliliter soil).

USFWS Dry Season Survey Request and Authorization

**From:** [Lantz, Samantha M](#)  
**Sent:** Tuesday, September 29, 2020 10:23 AM  
**To:** [Morgan Kennedy](#)  
**Cc:** [David Hochart](#); [Michael Henry](#); [Perkins-Taylor, Ian E](#)  
**Subject:** Re: (EXTERNAL) FW: USFWS Survey Request For Large Listed Branchiopods (Sacramento County)

---

You may consider this email authorization to conduct wet season and dry season surveys for large listed branchiopods in the proposed Sloughhouse Project survey area in Sacramento County, per the conditions of the relevant recovery permits (TE-53771B; TE-031848; TE-051248; TE-60147A; TE-813545) and as specified in your email request dated September 28, 2020.

Remember to carry a copy of your permit(s) while doing the work and to follow the terms and conditions of the permit(s), including the reporting requirements. In your report(s), please include which activities were authorized, the names of all persons involved in each activity, their recovery permit numbers, if applicable, and the date of this authorization, to help ensure that we correctly record the fulfillment of the reporting requirement under this authorization. We ask that you use UTM coordinates for all spatial data. Please use **Service reference number 2020-TA-3007** and send reports to me and Ian Perkins-Taylor (biologist in our Sac Valley division) (cced here).

Best,

Sam

**Subject:** *Request to the U.S. Fish and Wildlife Service to Conduct Wet and Dry Season Large Listed Branchiopod Surveys, Proposed Sloughhouse Project, Sacramento County, California*

Dear Sir or Madam:

Dudek is providing this request to the U.S. Fish and Wildlife Service (USFWS) to conduct both wet season and dry season surveys for large listed branchiopods (i.e., vernal pool fairy shrimp [*Branchinecta lynchi*] and vernal pool tadpole shrimp [*Lepidurus packardii*]) in the proposed Sloughhouse Project (Project) survey area (Attachment 1).

## Proposed Project and Survey Area

The survey area for the proposed Project could include a total of approximately 741.20 acres, pending on-going proposed Project design efforts (Attachment 2). According to the USFWS, the survey area is located in 'Survey Zone A' of California for listed large branchiopods.

## Potential Branchiopod Habitat

For the purpose of this request, Dudek evaluated potential branchiopod habitat within the survey area based on the following desktop data resources:

- California Aquatic Resources Inventory (CARI).<sup>1</sup>
- National Wetland Inventory (NWI).<sup>2</sup>
- South Sacramento Habitat Conservation Plan (SSHCP) land cover types.<sup>3</sup>
- U.S. Geological Society (USGS) National Hydrography dataset (NHD).<sup>4</sup>

The desktop evaluation of potential branchiopod habitat in the survey area found a total of 41.27 acres of potential habitat, as summarized in Table 1 below.

---

<sup>1</sup> SFEI (San Francisco Estuary Institute and the Aquatic Science Center). CARI. 2020. Accessed September 2020. <https://www.sfei.org/cari>.

<sup>2</sup> USFWS. 2020. NWI. Accessed September 2020. <https://www.fws.gov/wetlands/>.

<sup>4</sup> USGS. 2020. National Hydrography. Accessed September 2020. <https://www.usgs.gov/core-science-systems/ngp/national-hydrography>.

**Table 1. Summary of Potential Branchiopod Habitat Feature Types in Proposed Project Survey Area**

Aquatic Feature Type	Total of Individual Features in the Survey Area	Total Acreage of Features in Survey Area
Freshwater emergent wetland	4	13.92
Freshwater pond	3	1.32
Depressional seasonal feature	6	3.94
Individual vernal pool	79	17.34
Swale	45	4.00
Other- Depressional	1	0.75
<b>Totals</b>	<b>138</b>	<b>41.27</b>

The survey area does not contain USFWS Designated Critical Habitat (DCH). Specifically, there are DCH occurrences of vernal pool fairy shrimp (Unit VERFS 14B), and vernal pool tadpole shrimp (Unit VERTS 9A) approximately 1.4 miles southwest of the survey area.

## Survey Request Overview

Dudek would like to initiate dry season surveys as soon as possible in the survey area pending USFWS approval. If possible, the dry season surveys would be conducted before the 2020 through 2021 wet season (i.e., prior to November 1). In the case that precipitation events occur prior to the dry season survey timing detailed above, the dry season surveys for the proposed Project will be shifted to the following dry season (i.e., beginning May 2020).

Wet season surveys would commence approximately two weeks following the first precipitation events of the wet season (i.e., mid-November 2020); specifically when aquatic features hold greater than three centimeters of water 24 hours after a rain event. Wet season surveys would then continue every 14 days until the aquatic feature dries, or a minimum of 90 consecutive days of inundation have occurred. If pools dry down during the wet season and then inundate again, surveys will be re-initiated for those pools even if the 90 days of inundation have already occurred.

## Dry Season Survey

The dry season surveys will be conducted in accordance with the USFWS *Survey Guidelines for the Listed Large Branchiopods*<sup>5</sup>. Soil samples will be collected from the top centimeter, or one to three centimeters below overburden, of the aquatic features that have the potential to be branchiopod habitat. Soil samples will be collected when they are dry to avoid damaging or destroying cysts. A hand trowel, or similar instrument, will be used to collect approximately one liter volume sample per aquatic feature. Soil samples will be collected in chunks. The soil from each sampling location will be stored in separate bags and labeled with the specific location details from within the aquatic feature from which the sample was taken. A sketch of the aquatic feature

<sup>5</sup> USFWS. May 31, 2015. Survey Guidelines for the Large Listed Branchiopods. United State Department of the Interior. USFWS, Pacific Southwest Region. Accessed September 2020. [https://www.fws.gov/sacramento/es/Survey-Protocols-Guidelines/Documents/VernalPoolBranchiopodSurveyGuidelines\\_20150531.pdf](https://www.fws.gov/sacramento/es/Survey-Protocols-Guidelines/Documents/VernalPoolBranchiopodSurveyGuidelines_20150531.pdf).

showing the specific location of each soil sample location will be drawn. Photographs and field notes of each survey areas physical characteristics will also be recorded.

Per the USFWS guidelines, soil samples will be collected, stored, sieved, and cysts will be identifies as genus *Branchinecta* or *Lepidurus* if possible. Soil samples containing any residual moisture initially will be adequately ventilated and allowed to air dry thoroughly before storage of the sample. The bags containing the soil samples will be kept out of direct sunlight in order to avoid excessively heating the sample.

A total of 10 soil samples of approximately 100 ml each will to be taken from each aquatic feature, for a total soil sample volume of approximately one liter per aquatic feature.

In addition to the dry season survey request, Dudek would also like to request permission to culture/hydrate cysts in the laboratory once soils have been prepared. This will allow for the identification of adult branchiopods to the species-level. Specifically, washed and sieved soil fractions from the 300 um and 150 um sieves will be examined under a dissecting microscope for fairy shrimp or tadpole shrimp cysts. The process will be repeated until all individual soil samples have been examined. All sieved material will be processed and dried as quickly as possible, preferably within one hour from the initial wetting. Cyst density information for each soil sample location will be calculated by dividing the total number of cysts recovered by the total amount of soil from the individual aliquots from that soil sample location. Total cyst density information for each soil sample location will be reported for each species in terms of the following: none; 1 to 25 cysts/100 ml soil; 26 to 50 cysts/100 ml soil; 51 to 100 cysts/100 ml soil; 101 to 199 cysts/100 ml soil; or more than 200 cysts/100 ml soil. If cysts can be identified to the species-level, then one of three methods to determine species will be applied: 1) hydrate and grow them out, though this is not always feasible due to the many factors that go into hatching and growing fairy shrimp; 2) suspend the survey and agree that they are of a listed species; or (3) complete a subsequent wet season survey according to the full protocol. Voucher specimens of adult branchiopods will be preserved, identified to the species level and transferred to an approved repository.

The results of the dry season survey will be documented within a protocol-level report. The report will include a discussion of the survey methodology and adequacy, including a description of any resource documents referenced and field survey methods used during the survey work. The report will include appropriate tables and graphics to meet the reporting requirements of the USFWS. According to USFWS requirements, the report will be submitted within 90 days of completing the survey.

## Wet Season Survey

Protocol-level wet season surveys will also be conducted in accordance with the USFWS guidelines and timing during the wet season as identified above. At each wet season visit, representative portions of the bottom, edges, and vertical water column of the aquatic feature shall be adequately sampled using a seine, dip net or aquarium net appropriate for the size of the feature. As part of the wet season surveys, Dudek will also sample water quality (i.e., pH, total dissolved solids/electro-conductivity, and temperature), and document empirical observations made at each aquatic feature surveyed. Photographs and field notes on each survey areas physical characteristics will be recorded.

The results of the wet season survey will be documented within a protocol-level report. The report will include a discussion of the survey methodology and adequacy, including a description of any resource documents referenced

and field survey methods used during the survey work. The report will include appropriate tables and graphics to meet the reporting requirements of the USFWS. According to USFWS requirements, the report will be submitted within 90 days of completing the survey.

## Survey Personnel

Dudek may employ several of our permitted biologists to conduct wet and dry season surveys in the proposed Project survey area. Each permitted biologist will be accompanied by one or more supporting biological staff that have had appropriate field experience to assist in these surveys. Table 2 below lists all Dudek biologists that hold a Recovery 10(a)(1)(a) Permit, and/or supporting biological field staff that that Dudek has is requesting to have approved to conduct large listed branchiopod surveys in the proposed Project survey area.

**Table 2. Dudek Survey Personnel Reference**

**INTRODUCTION**

Helm Biological Consulting (HBC), a division of Tansley Team, Inc., was contracted by Dudek to perform an analysis of soils collected from dry seasonally inundated depressions (hereafter “basins”) at the Proposed Sloughhouse Project (hereafter “Project”), for the presence of large branchiopods (fairy shrimp, tadpole shrimp) that are listed as threatened or endangered under the federal Endangered Species Act (e.g., vernal pool fairy shrimp [*Branchinecta lynchi*] and the vernal pool tadpole shrimp [*Lepidurus packardii*]).

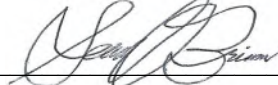

The Project could include a total of approximately 741.20 acres, pending on-going proposed Project design efforts (Figure 1). The Project is located immediately west of Dillard Road, south of Meiss Road, and east of the Consumes River in Sacramento County, California. Additionally, the Project is located in an unsectioned portion of Township 7 North, Range 7 East, and Mt. Diablo Base & Meridian (MDB&M) of the Sloughhouse U.S. Geological Survey (USGS) 7.5-minute quadrangle map. The Project’s approximate center coordinates (World Geodetic System 1984 [WGS84]) are: 38.471667°, -121.180248°.

The remainder of this report discusses the methods and results of the soil examinations to determine the presence of federally-listed large branchiopods at the Project.

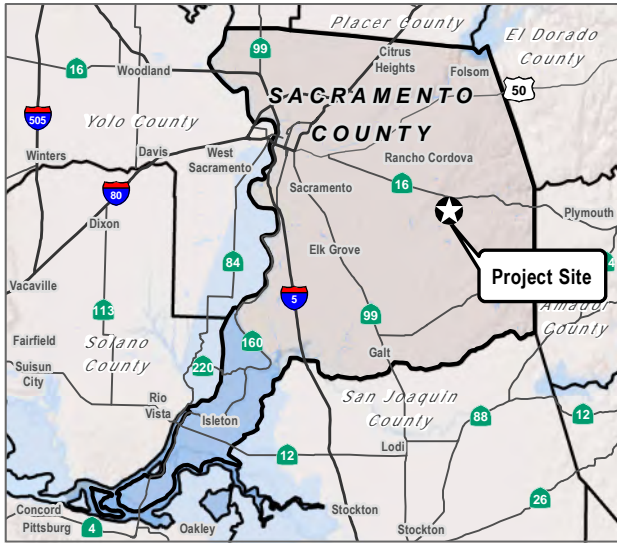

“We certify that the information in this survey report and attached exhibits fully and accurately represents our work.”

Sloughouse Project (Category: Other) - USFWS Listed Large Branchiopod Survey Notification, City of Sloughouse, Sacramento County

## METHODS

Methods followed U.S. Fish and Wildlife Service's (USFWS 2017) *Survey Guidelines for Listed Large Branchiopods* for dry-season sampling and consisted of first soil collection and then soil processing and analysis as described below.

### SOIL COLLECTION

Dry soils were collected on October 13-16, 19-22, November 11, 2020 by Heather Moine of Dudek as authorized by USFWS under permit numbers TE-60147A-1 of Section 10(a)(1)(A) of the federal Endangered Species Act (ESA), 16 U.S.C. 1531 et seq., and its implementing regulations (Appendix A). Heather Moine was supported by Laura Burris, Allie Sennett, Anna Godhino, Paul Lemons (USFWS permit # TE-051248-6), and Emily Scricca.

A small 6-inch hand trowel was used to excavate ten samples (approximately 100 milliliter each) of dry soil from the bottom of each seasonal feature. Soil samples were collected equidistantly along two perpendicular transects (lengthwise [transect A] and widthwise [transect B]), incorporating the deepest region of the seasonal feature. If neither transect passed within the second deepest region of the seasonal feature, another soil sample was taken to specifically include it; however, no more than ten soils samples were extracted from a set of perpendicular transects.

Dry season surveys were conducted prior to the completion of the U.S. Army Corps of Engineers (USACE)-level aquatic resources delineation to meet overarching Project schedules. As such, some aquatic resource features were not sampled because they were not identified as an aquatic resource during the delineation process and/or they were not considered federally-listed large branchiopod habitat.

The collected soils were delivered to HBC for subsequent processing and analysis as described below.

### SOIL PROCESSING AND ANALYSIS

Soil samples obtained from Dudek were processed and analyzed by Dr. Brent Helm of HBC as authorized by the USFWS under recovery permit number TE-795930-10.2 of Section 10(a)(1)(A) of the federal ESA, 16 U.S.C. 1531 et seq., and its implementing regulations (Appendix A). In HBC's laboratory, a brine solution was prepared by mixing table salt (NaCl) with lukewarm tap water in a large container. The collected soil material was placed in the brine solution. The soil material was then gently worked by hand to breakdown any persistent soil structure. The organic material rising to the top of the brine solution was skimmed off and placed in a 600-micron diameter pore-size sieve stacked atop a 75-micron diameter pore-size sieve. The soil material was processed through the top sieve by flushing it with lukewarm tap water

---

while gently rubbing it with a soft-bristle brush. The soil retained from the 75-micron diameter pore size sieve was then removed and thinly ( $\approx 1.0$  mm) spread into plastic petri dishes.

The contents of each petri dish were examined under a 10 to 252-power zoom binocular microscope. A minimum of 0.5-hour was spent searching the contents of each petri dish for large branchiopod cysts (embryonic eggs). Dr. Helm's large branchiopod cyst reference collection and scanning electron micrographs of cysts (Belk 1989, Brendock *et al.* 2008, Gilchrist 1978, Hill and Shepard 1998, Mura 1991, and Rabet 2010) were used to identify and compare any cysts observed within the soil samples. This processing method (described above) favors the detection of cysts belonging to the genera *Branchinecta*, *Lepidurus*, and *Streptocephalus* since these three genera have species that are federally listed. Evidence of other aquatic macroinvertebrates encountered was also noted on the laboratory data sheet.

## RESULTS

### SOIL COLLECTION

Dudek collected soils from a total of 67 features within the Project (Exhibit A).

### SOIL PROCESSING AND ANALYSIS

All of the soils collected by Dudek were processed and analyzed for evidence of large branchiopods. No evidence of federally-listed large branchiopods (i.e., cysts belonging to the genus *Branchinecta* or *Lepidurus* or carapaces of *Lepidurus*) were observed in the soils collected (Table 1). However, cysts belonging to the non-listed California fairy shrimp (*Linderiella occidentalis*) were observed in the soils collected from six features (ID-01, P-02, SW-17, SW-18, SWS-07, and VP-15). Representative photographs of the aquatic resource features occurring at the Project are provided in Appendix B.

**APPENDIX A.**  
**USFWS AUTHORIZATION**

**From:** [Lantz, Samantha M](#)  
**Sent:** Tuesday, September 29, 2020 10:23 AM  
**To:** [Morgan Kennedy](#)  
**Cc:** [David Hochart](#); [Michael Henry](#); [Perkins-Taylor, Ian](#) E  
**Subject:** Re: [EXTERNAL] FW: USFWS Survey Request For Large Listed Branchiopods (Sacramento County)

---

You may consider this email authorization to conduct wet season and dry season surveys for large listed branchiopods in the proposed Sloughhouse Project survey area in Sacramento County, per the conditions of the relevant recovery permits (TE-53771B; TE-031848; TE-051248; TE-60147A; TE-813545) and as specified in your email request dated September 28, 2020.

Remember to carry a copy of your permit(s) while doing the work and to follow the terms and conditions of the permit(s), including the reporting requirements. In your report(s), please include which activities were authorized, the names of all persons involved in each activity, their recovery permit numbers, if applicable, and the date of this authorization, to help ensure that we correctly record the fulfillment of the reporting requirement under this authorization. We ask that you use UTM coordinates for all spatial data. Please use **Service reference number 2020-TA-3007** and send reports to me and Ian Perkins-Taylor (biologist in our Sac Valley division) (cced here).

Best,

Sam

In an effort to slow the spread of the coronavirus (COVID-19), staff in the Sacramento Fish and Wildlife Office have implemented an aggressive telework schedule. At this time, we are responding to requests for information via email or phone as often as possible as we do not have the in-office capacity to support regular mail service. We appreciate your understanding.

**Subject:** *U.S. Fish and Wildlife Service Wet Season Protocol Survey Letter Report for Federally Listed Branchiopods, Sloughhouse Solar Project, Sacramento County, California (USFWS#2020-TA-3007)*

Dear Ms. Lantz and Mr. Perkins-Taylor:

This U.S. Fish and Wildlife Service (USFWS) Wet Season Protocol Survey Letter Report (Report) for federally listed branchiopods has been prepared in accordance with the USFWS *Survey Guidelines for the Listed Large Branchiopods*<sup>1</sup> and to fulfill reporting requirements in accordance with the 10(a)(1)(A) permit holder's recovery permit. This Report provides a complete overview of the wet season surveys conducted for the Sloughhouse Solar Project (Project). If you have any questions regarding this Report, or need any additional information, please feel free to call or email me at (916) 661-2498, mkennedy@dudek.com.

Sincerely,

---

<sup>1</sup> USFWS (U.S. Fish and Wildlife Service). November 13, 2017. Survey Guidelines for the Large Listed Branchiopods. United State Department of the Interior. USFWS, Pacific Southwest Region. Accessed October 2020-June 2021. <https://www.fws.gov/ventura/docs/species/protocols/vpshrimp/shrimp2017.pdf>.

# 1 Introduction

This Report documents the results of the wet season surveys for vernal pool branchiopods conducted within the Project Study Area (PSA) located in south eastern Sacramento County, California. Surveys focused on the determination of presence/no presence for the federally threatened vernal pool fairy shrimp (*Branchinecta lynchi*) and federally endangered vernal pool tadpole shrimp (*Lepidurus packardii*). Surveys were performed in accordance with the protocols listed above. No wet season surveys have been previously conducted as part of the Project. Wet season surveys were conducted between February 3, 2021 and April 28, 2021.

The request to conduct wet season surveys was submitted to the USFWS on September 28, 2020 and approved by the USFWS on September 29, 2020 (Attachment A). Wet season surveys were conducted over 15 total days within the PSA in February, March, and April 2021. Wet season surveys were led and performed by Heather Moine, a Dudek biologist holding a Section 10(a)(1)(A) permit and a Specific Use Scientific Collecting Permit (TE-60147A-1; S-202420002-20262-001). The permitted biologist was supported by Dudek biologists with appropriate field experience including Laura Burris, Adam Crawford, Sarah Foster, Anna Godinho, Paul Keating, Morgan Kennedy, Allie Sennett, and Naomi Serratos. A summary of wet season survey dates, PSA environmental conditions, and biologists who conducted the surveys is provided in Table 1 below.

**Table 1. Wet Season Survey Dates, Site Conditions, and Biologists Present Summary**

| Date of Survey    | Site Conditions                             | Permitted Biologist        | Assisting Biologists          |

<sup>a</sup> Heather Moine Section 10(a)(1)(A) permitted (TE-60147A-1)

## 2 Project Setting

### 2.1 Location

The approximately 742.44-acre PSA is located at the southwest corner of the intersection of Meiss Road and Dillard Road in the unincorporated community of Sloughhouse within south eastern Sacramento County. The PSA excludes existing solar facilities within the site. The PSA is primarily used for cattle grazing or other agricultural operations, and there is an existing solar facility located in the southeast corner of the site (Attachment B). It should be noted that the PSA changed slightly from the original USFWS request authorization resulting in a change from 741.20 acres to 742.44 acres to include two roadside ditches along Dillard Road; however, these roadside ditches were not sampled during the wet season surveys. Project location details are detailed as follows:

- County: Sacramento.
- Public Land Survey System: Cosumnes Land Grant.
- U.S. Geological Survey (USGS) 7.5-Minute Quadrangle (Quad): Sloughhouse.
- Latitude, Longitude: 38.473731, -121.184568 (centroid, decimal degrees).

- Average Elevation: 128 feet amsl.
- PSA: 742.44 acres.

### 2.2 Soils

According to the Natural Resources Conservation Service<sup>2</sup>, 16 soil units are present within the PSA (Attachment C). Each soil unit, typical landform or geomorphic position within the landscape, drainage class (i.e., frequency and

duration of wet periods in conditions similar to those in which it was developed), hydric listing, and total area is detailed in Table 2 below.

**Table 2. Summary of Soil Units Within the Project Study Area (PSA)**

| Soil Map Unit Name                                  | Landform                       | Drainage Class                                | Hydric | Total Area (acres) |
|-----------------------------------------------------|--------------------------------|-----------------------------------------------|--------|--------------------|
| Bruella sandy loam, 0–2% slopes                     | Terraces                       | Well-drained                                  | No     | 3.15               |
| Bruella sandy loam, 2–5% slopes                     | Terraces                       | Well-drained                                  | No     | 58.80              |
| Columbia sandy loam, 0–2% slopes                    | Flood plains                   | Somewhat poorly drained, occasionally flooded | Yes    | 17.93              |
| Galt clay, 0–1% slopes                              | Basin floors on fan remnants   | Somewhat poorly drained                       | Yes    | 33.0               |
| Galt clay, 2-5% slopes                              | Basin floors on fan remnants   | Moderately well drained                       | Yes    | 126.62             |
| Hadselville-Pentz complex, 2–30% slopes             | Hills                          | Moderately well drained to well drained       | No     | 231.74             |
| Peters clay, 1–8% slopes                            | Hills                          | Well drained                                  | No     | 56.94              |
| Redding gravelly loam, 0–8% slopes                  | Fan remnants                   | Moderately well drained                       | No     | 15.29              |
| Reiff fine sandy loam, 0–2% slopes                  | Flood plains                   | Well drained, occasionally flooded            | No     | 96.11              |
| Sailboat silt loam, drained, 0–2% slopes            | Flood plains on natural levees | Somewhat poorly drained, occasionally flooded | Yes    | 3.50               |
| San Joaquin silt loam, 0–3% slopes                  | Terraces                       | Moderately well drained                       | No     | 14.02              |
| San Joaquin silt loam, 0–8% slopes                  | Terraces                       | Moderately well drained                       | No     | 54.45              |
| San Joaquin-Durixeralfs complex, 0–1% slopes        | Terraces                       | Moderately well drained to well drained       | No     | 0.25               |
| San Joaquin-Galt complex, leveled, 0–1% slopes      | Terraces                       | Moderately well drained                       | Yes    | 2.87               |
| San Joaquin-Galt complex, 0–3% slopes               | Terraces                       | Moderately well drained                       | Yes    | 18.55              |
| San Joaquin-Xerarents complex, leveled, 0–1% slopes | Terraces                       | Moderately well drained to well drained       | No     | 4.89               |

Source: USDA 2021

**Notes:**

The total soil cover (738.11 acres) does not account for aquatic or developed land cover, and therefore is less than the overall PSA (742.44 acres).

### 2.3 Watershed and Hydrology

The PSA is located within the Upper Cosumnes River watershed, which drains approximately 180 square miles of land in El Dorado, Amador, and Sacramento Counties (Hydrological Unit Code 1804001306)<sup>3</sup>. A complex of seasonally inundated aquatic features generally drains the Project in a southwesterly direction, and the Cosumnes River flows within the western boundary of the PSA. The western half of the PSA is located within the National Flood

<sup>3</sup> CDFW (California Department of Fish and Wildlife). 2020. *Biogeographic Information and Observation System: BIOS Viewer Version 5.94.01*. Accessed December 2020. <http://www.dfg.ca.gov/biogeodata/bios/>.

Hazard Layer 1% 100-year floodplain of the Cosumnes River<sup>4</sup>. However, the Cosumnes River within the PSA is bounded by levees intended to contain the river and protect against overtopping during a normal rain year (Attachment D).

### 2.3.1 Aquatic Resources

Dudek conducted an Aquatic Resources Delineation (ARD) within the PSA on October 27, 29, and 30, November 4 and 9 through 13, 2020, and March 3, 2021. The purpose of an ARD is to identify aquatic resources that may be potentially subject to agency jurisdiction pursuant to regulations in Section 401 and 404 of the Clean Water Act, Porter-Cologne Act, California Fish and Game Code, and California Environmental Quality Act Guidelines. Aquatic resources within the PSA were delineated based on methodology described in the *US Army Corps of Engineers Wetlands Delineation Manual* (US Army Corps of Engineers [USACE] 1987<sup>5</sup>) and the *Regional Supplement for the Arid West Region* (USACE 2008a<sup>6</sup>). Non-wetland waters of the United States and/or state were delineated based on the presence of an ordinary high water mark (OHWM), as determined using the methodology in the *OHWM Field Guide for the Arid West Region* (USACE 2008b<sup>7</sup>). Aquatic resources were recorded and mapped in the field using a Trimble R1 Global Navigation Satellite System Receiver with sub-meter accuracy and ArcGIS Collector app for iOS. On June 9, 2021 the final ARD Report with a formal request for an Approved Jurisdictional Delineation was submitted to the USACE, Sacramento District, to definitively determine and approve the extent of waters of the United States.

A total of ten aquatic resource types were documented in the proposed Project area and the potential mitigation lands of the PSA, including freshwater emergent wetland, seasonal wetland, stock pond, vernal pool, ditch, ephemeral drainage, intermittent drainage, perennial drainage, seasonal wetland swale, and upland swale, as included in Table 3.

## 2.4 Vegetation Communities and Land Cover

General vegetation communities and land cover types were documented within the PSA (Attachment E) and include the following:

- California annual grassland (combines California annual grassland and valley grassland) is the dominant vegetation community present within the PSA. Dominant species in this community include soft brome (*Bromus hordeaceus*), medusa head (*Elymus caput-medusae*), and narrow tarweed (*Holocarpha virgata*). The shrub and tree layer are absent from this vegetation community. Numerous aquatic features occur throughout the grassland.
- Valley oak woodland (combines mixed riparian woodland and valley foothill riparian) comprises the riparian habitat along the Cosumnes River, a portion of which is located within the northern extent of the PSA. Valley oak (*Quercus lobata*) was the dominant overstory species, with a lesser abundance of Fremont's cottonwood (*Populus fremontii*), Goodding's willow (*Salix gooddingii*), Northern California walnut (*Juglans hindsii*), and oak species (*Quercus* spp.). Shrubs occurred intermittently and included Himalayan blackberry (*Rubus armeniacus*) and California grape (*Vitis californica*). The herbaceous layer was dominated by disturbance-tolerant upland species, including yellow star-thistle (*Centaurea solstitialis*), Italian plumeless thistle (*Carduus pycnocephalus*), and non-native grasses like those described for California annual grassland.
- Agricultural – Land cover classified as agricultural typically includes lands where farming and other agricultural practices take place, including pastures, row crops and other unidentified croplands. Production practices observed in the PSA include flood-irrigation, and cultivation; followed by harvesting and discing. After discing, some fields appear to remain fallow for short periods of time, allowing for the

establishment of annual and biennial native and non-native annual grasses and broad-leaved plants, including many non-native species.

- Developed (combines low density development and urban) – This land cover type includes areas that have been completely altered by human activities and contain little to no vegetation. Specifically, such areas include buildings, paved and gravel roadways and trails, gravel lots, and other constructed environments. Disturbed land cover in the PSA includes two residences along Meiss Road, and the existing solar facility in the southeast vicinity of the PSA along Dillard Road.

### 3 Methodology

Wet season surveys were performed in accordance with the USFWS *Survey Guidelines for the Listed Large Branchiopods*<sup>8</sup> and the 10(a)(1)(A) permit holder’s recovery permit. For the wet season surveys, site visits began after initial storm events when potential listed large branchiopod habitat had become inundated. All potential habitat was sampled at 14-day intervals after initial inundation of habitat. Sampling continued within each potential habitat until it dried. At each wet season visit, representative portions of the bottom, edges, and vertical water column of the features were adequately sampled using a seine, dip net, or aquarium net. The contents of the nets were examined and emptied frequently. Information on pool conditions and species were recorded.

### 4 Results

A total of 113 features were surveyed during the 2020/2021 wet season survey. The features consisted of freshwater emergent wetland, seasonal wetland, stock pond, vernal pool, ditch, ephemeral drainage, intermittent drainage, perennial drainage, river, seasonal wetland swale, upland swale, and ponded features. During the seven survey passes (including 15 survey days), none of the features were found occupied by federally threatened vernal pool fairy shrimp (*Branchinecta lynchi*), federally endangered vernal pool tadpole shrimp (*Lepidurus packardii*), or any other federally listed large branchiopods. However, the non-listed California fairy shrimp (*Lindleriella occidentalis*) were observed in six features (D-02, P-02, SW-28, US-03, VP-07, and VP-16). A summary of results has been provided in Table 4. Additionally, photo plates of the PSA and various aquatic features sampled have been provided (Attachment G). Data sheets with results by feature and by date have been provided in Attachment H.

**Notes:**

LIOC - *Lindieriella occidentalis*

## 5 Conclusion

I certify that the information in this Report for the wet season surveys conducted within the PSA and attached exhibits fully and accurately represents my work.

USFWS Wet Season Survey Request and Authorization

**From:** [Lantz, Samantha M](#)  
**Sent:** Tuesday, September 29, 2020 10:23 AM  
**To:** [Morgan Kennedy](#)  
**Cc:** [David Hochart](#); [Michael Henry](#); [Perkins-Taylor, Ian E](#)  
**Subject:** Re: [EXTERNAL] FW: USFWS Survey Request For Large Listed Branchiopods (Sacramento County)

---

You may consider this email authorization to conduct wet season and dry season surveys for large listed branchiopods in the proposed Sloughhouse Project survey area in Sacramento County, per the conditions of the relevant recovery permits (TE-53771B; TE-031848; TE-051248; TE-60147A; TE-813545) and as specified in your email request dated September 28, 2020.

Remember to carry a copy of your permit(s) while doing the work and to follow the terms and conditions of the permit(s), including the reporting requirements. In your report(s), please include which activities were authorized, the names of all persons involved in each activity, their recovery permit numbers, if applicable, and the date of this authorization, to help ensure that we correctly record the fulfillment of the reporting requirement under this authorization. We ask that you use UTM coordinates for all spatial data. Please use **Service reference number 2020-TA-3007** and send reports to me and Ian Perkins-Taylor (biologist in our Sac Valley division) (cced here).

Best,

Sam

Good Morning Samantha,

Yes, please move forward with processing the request for surveys, excluding Paul Lemons.

Thanks,

**Morgan Kennedy**

Hi Morgan,

We're missing a 2019 annual report for Paul Lemons. Please let me know if you want me to move forward with the survey authorizaon f or Dudek except for Mr. Lemons. Alternav ely, I can wait and process the request upon receipt of the missing report. (Apologies in advance if it was sent but not filed properly.)

Thanks,

Sam

**This email has been received from outside of DOI - Use caution before clicking on links, opening attachments, or responding.**

Good A. ernoon,

Dudek is providing this request to the U.S. Fish and Wildlife Service (USFWS) to conduct both wet season and dry season surveys for large listed branchiopods (i.e., vernal pool fairy shrimp [*Branchinecta lynchi*] and vernal pool tadpole shrimp [*Lepidurus packardii*]) in the proposed Sloughhouse Project (Project) survey area, Sacramento County, California. Please see attached formal request.

If you have any questions regarding this request, please feel free to contact me anytime at [morgkennedy@gmail.com](mailto:morgkennedy@gmail.com), 916.661.2498. Thank you for your consideration.

**Morgan Kennedy**

**Subject:** *Request to the U.S. Fish and Wildlife Service to Conduct Wet and Dry Season Large Listed Branchiopod Surveys, Proposed Sloughouse Project, Sacramento County, California*

Dear Sir or Madam:

Dudek is providing this request to the U.S. Fish and Wildlife Service (USFWS) to conduct both wet season and dry season surveys for large listed branchiopods (i.e., vernal pool fairy shrimp [*Branchinecta lynchi*] and vernal pool tadpole shrimp [*Lepidurus packardii*]) in the proposed Sloughouse Project (Project) survey area (Attachment 1).

## Proposed Project and Survey Area

The survey area for the proposed Project could include a total of approximately 741.20 acres, pending on-going proposed Project design efforts (Attachment 2). According to the USFWS, the survey area is located in 'Survey Zone A' of California for listed large branchiopods.

## Potential Branchiopod Habitat

For the purpose of this request, Dudek evaluated potential branchiopod habitat within the survey area based on the following desktop data resources:

- California Aquatic Resources Inventory (CARI).<sup>1</sup>
- National Wetland Inventory (NWI).<sup>2</sup>
- South Sacramento Habitat Conservation Plan (SSHCP) land cover types.<sup>3</sup>
- U.S. Geological Society (USGS) National Hydrography dataset (NHD).<sup>4</sup>

The desktop evaluation of potential branchiopod habitat in the survey area found a total of 41.27 acres of potential habitat, as summarized in Table 1 below.

---

<sup>1</sup> SFEI (San Francisco Estuary Institute and the Aquatic Science Center). CARI. 2020. Accessed September 2020. <https://www.sfei.org/cari>.

<sup>2</sup> USFWS. 2020. NWI. Accessed September 2020. <https://www.fws.gov/wetlands/>.

<sup>4</sup> USGS. 2020. National Hydrography. Accessed September 2020. <https://www.usgs.gov/core-science-systems/ngp/national-hydrography>.

**Table 1. Summary of Potential Branchiopod Habitat Feature Types in Proposed Project Survey Area**

| Aquatic Feature Type          | Total of Individual Features in the Survey Area | Total Acreage of Features in Survey Area |
|-------------------------------|-------------------------------------------------|------------------------------------------|
| Freshwater emergent wetland   | 4                                               | 13.92                                    |
| Freshwater pond               | 3                                               | 1.32                                     |
| Depressional seasonal feature | 6                                               | 3.94                                     |
| Individual vernal pool        | 79                                              | 17.34                                    |
| Swale                         | 45                                              | 4.00                                     |
| Other- Depressional           | 1                                               | 0.75                                     |
| <b>Totals</b>                 | <b>138</b>                                      | <b>41.27</b>                             |

The survey area does not contain USFWS Designated Critical Habitat (DCH). Specifically, there are DCH occurrences of vernal pool fairy shrimp (Unit VERFS 14B), and vernal pool tadpole shrimp (Unit VERTS 9A) approximately 1.4 miles southwest of the survey area.

## Survey Request Overview

Dudek would like to initiate dry season surveys as soon as possible in the survey area pending USFWS approval. If possible, the dry season surveys would be conducted before the 2020 through 2021 wet season (i.e., prior to November 1). In the case that precipitation events occur prior to the dry season survey timing detailed above, the dry season surveys for the proposed Project will be shifted to the following dry season (i.e., beginning May 2020).

Wet season surveys would commence approximately two weeks following the first precipitation events of the wet season (i.e., mid-November 2020); specifically when aquatic features hold greater than three centimeters of water 24 hours after a rain event. Wet season surveys would then continue every 14 days until the aquatic feature dries, or a minimum of 90 consecutive days of inundation have occurred. If pools dry down during the wet season and then inundate again, surveys will be re-initiated for those pools even if the 90 days of inundation have already occurred.

## Dry Season Survey

The dry season surveys will be conducted in accordance with the USFWS *Survey Guidelines for the Listed Large Branchiopods*<sup>5</sup>. Soil samples will be collected from the top centimeter, or one to three centimeters below overburden, of the aquatic features that have the potential to be branchiopod habitat. Soil samples will be collected when they are dry to avoid damaging or destroying cysts. A hand trowel, or similar instrument, will be used to collect approximately one liter volume sample per aquatic feature. Soil samples will be collected in chunks. The soil from each sampling location will be stored in separate bags and labeled with the specific location details from within the aquatic feature from which the sample was taken. A sketch of the aquatic feature

<sup>5</sup> USFWS. May 31, 2015. Survey Guidelines for the Large Listed Branchiopods. United State Department of the Interior. USFWS, Pacific Southwest Region. Accessed September 2020. [https://www.fws.gov/sacramento/es/Survey-Protocols-Guidelines/Documents/VernalPoolBranchiopodSurveyGuidelines\\_20150531.pdf](https://www.fws.gov/sacramento/es/Survey-Protocols-Guidelines/Documents/VernalPoolBranchiopodSurveyGuidelines_20150531.pdf).

showing the specific location of each soil sample location will be drawn. Photographs and field notes of each survey areas physical characteristics will also be recorded.

Per the USFWS guidelines, soil samples will be collected, stored, sieved, and cysts will be identifies as genus *Branchinecta* or *Lepidurus* if possible. Soil samples containing any residual moisture initially will be adequately ventilated and allowed to air dry thoroughly before storage of the sample. The bags containing the soil samples will be kept out of direct sunlight in order to avoid excessively heating the sample.

A total of 10 soil samples of approximately 100 ml each will to be taken from each aquatic feature, for a total soil sample volume of approximately one liter per aquatic feature.

In addition to the dry season survey request, Dudek would also like to request permission to culture/hydrate cysts in the laboratory once soils have been prepared. This will allow for the identification of adult branchiopods to the species-level. Specifically, washed and sieved soil fractions from the 300 um and 150 um sieves will be examined under a dissecting microscope for fairy shrimp or tadpole shrimp cysts. The process will be repeated until all individual soil samples have been examined. All sieved material will be processed and dried as quickly as possible, preferably within one hour from the initial wetting. Cyst density information for each soil sample location will be calculated by dividing the total number of cysts recovered by the total amount of soil from the individual aliquots from that soil sample location. Total cyst density information for each soil sample location will be reported for each species in terms of the following: none; 1 to 25 cysts/100 ml soil; 26 to 50 cysts/100 ml soil; 51 to 100 cysts/100 ml soil; 101 to 199 cysts/100 ml soil; or more than 200 cysts/100 ml soil. If cysts can be identified to the species-level, then one of three methods to determine species will be applied: 1) hydrate and grow them out, though this is not always feasible due to the many factors that go into hatching and growing fairy shrimp; 2) suspend the survey and agree that they are of a listed species; or (3) complete a subsequent wet season survey according to the full protocol. Voucher specimens of adult branchiopods will be preserved, identified to the species level and transferred to an approved repository.

The results of the dry season survey will be documented within a protocol-level report. The report will include a discussion of the survey methodology and adequacy, including a description of any resource documents referenced and field survey methods used during the survey work. The report will include appropriate tables and graphics to meet the reporting requirements of the USFWS. According to USFWS requirements, the report will be submitted within 90 days of completing the survey.

## Wet Season Survey

Protocol-level wet season surveys will also be conducted in accordance with the USFWS guidelines and timing during the wet season as identified above. At each wet season visit, representative portions of the bottom, edges, and vertical water column of the aquatic feature shall be adequately sampled using a seine, dip net or aquarium net appropriate for the size of the feature. As part of the wet season surveys, Dudek will also sample water quality (i.e., pH, total dissolved solids/electro-conductivity, and temperature), and document empirical observations made at each aquatic feature surveyed. Photographs and field notes on each survey areas physical characteristics will be recorded.

The results of the wet season survey will be documented within a protocol-level report. The report will include a discussion of the survey methodology and adequacy, including a description of any resource documents referenced

and field survey methods used during the survey work. The report will include appropriate tables and graphics to meet the reporting requirements of the USFWS. According to USFWS requirements, the report will be submitted within 90 days of completing the survey.

## Survey Personnel

Dudek may employ several of our permitted biologists to conduct wet and dry season surveys in the proposed Project survey area. Each permitted biologist will be accompanied by one or more supporting biological staff that have had appropriate field experience to assist in these surveys. Table 2 below lists all Dudek biologists that hold a Recovery 10(a)(1)(a) Permit, and/or supporting biological field staff that that Dudek has is requesting to have approved to conduct large listed branchiopod surveys in the proposed Project survey area.

**Table 2. Dudek Survey Personnel Reference**

# 1 Executive Summary

This Aquatic Resources Delineation Report (report) was prepared in accordance with the U.S. Army Corps of Engineers (USACE) *Sacramento District Minimum Standards for Acceptance of Aquatic Resources Delineation Reports* (USACE 2016), the *USACE Wetland Delineation Manual* (USACE 1987), the *USACE Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (USACE 2008a), and the *USACE Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (USACE 2008b). Dudek conducted a field delineation in October and November 2020 to identify aquatic resources in the approximately 732.26-acre Project Study Area (PSA) that may be potentially subject to agency jurisdiction pursuant to regulations in Sections 401 and 404 of the Clean Water Act (CWA), Porter-Cologne Water Quality Control Act, and California Fish and Game Code (FGC). Specifically, the PSA is comprised of the solar development area of approximately 371.72 acres, and the adjacent other lands of 360.54 acres. Below, Table 1, Summary of Aquatic Resources in the Project Study Area, summarizes the delineation findings. Potential jurisdictional determinations, as discussed in Section 6, Conclusion, are considered preliminary until verified by the USACE Sacramento District.

**Table 1. Summary of Aquatic Resources in the Project Study Area**

| Feature ID                                  | Cowardin Code <sup>1</sup> | PSA – Total Acreage | PSA – Total Linear Feet |
|---------------------------------------------|----------------------------|---------------------|-------------------------|

## 2 Introduction

This report documents the methods and results of the aquatic resources delineation within the approximately 732.26-acre PSA for the Sloughhouse Solar Project (Project) in Sacramento County, California (Figure 1). This report identifies the potentially jurisdictional aquatic resources within the PSA that may be subject to agency jurisdiction pursuant to regulations in Section 404 of the Clean Water Act (CWA). This report was produced in accordance with the USACE *Sacramento District Minimum Standards for Acceptance of Aquatic Resources Delineation Reports* (USACE 2016), the *USACE Wetland Delineation Manual* (USACE 1987), the *USACE Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (USACE 2008a), and the *USACE Field Guide to the Identification of the OHWM in the Arid West Region of the Western United States* (USACE 2008b). This report is being provided to the USACE with a *Request for Aquatic Resources Delineation Verification or Jurisdictional Determination* (USACE 2017) (Appendix A, Request for Aquatic Resources Delineation Verification or Jurisdictional Determination). The results of this delineation are considered preliminary until verified by the Sacramento District of USACE.

Furthermore, the delineation conducted within the PSA also defined areas under the jurisdiction of California Department of Fish and Wildlife (CDFW), pursuant to Sections 1600 through 1603 of the California Fish and Game Code (FGC), and the Regional Water Quality Control Board (RWQCB), pursuant to CWA Section 401 and the Porter-Cologne Water Quality Control Act.

### 2.1 Project Description

The Project is a solar photovoltaic energy-generating facility located on the southwest corner of Meiss Road and Dillard Road, adjacent to an existing solar energy facility located at 7794 Dillard Road, Sacramento County, California. The Project is being proposed to be developed by Sloughhouse Solar, LLC (Applicant) to sell its electricity and all renewable and environmental attributes to an electric utility purchaser under long-term contracts to help meet California Renewables Portfolio Standard goals. The Project proponent would construct, operate, and decommission a solar generation and energy storage facility within a solar development area of approximately 371.72 acres (inclusive of solar field, energy storage, Project substation(s), roads, retention basins, etc.) within the greater approximately 732.26-acre PSA. The remaining 360.54 acres of the PSA are being included in this report to be referred to as adjacent other lands. The Project may also include additional auxiliary facilities such as raw water/fire water storage, treated water storage, stormwater retention basins, water filtration buildings and equipment, and equipment control buildings, septic system(s), and parking within the proposed development area. The design and construction of the buildings, solar arrays (panels, etc.), energy storage facilities, and auxiliary facilities will be consistent with Sacramento County building standards. The Project design is preliminary and not yet finalized.

### 2.2 Project Location and Directions

The approximately 732.26-acre PSA is located at the southwest corner of the intersection of Meiss Road and Dillard Road in Sloughhouse in eastern Sacramento County (Figure 1). To get to the PSA from Sacramento, travel east on U.S. 50 for approximately 6 miles. Take exit 11 for Watt Avenue and turn right onto South Watt Avenue, continuing for 1.5 miles. Turn left onto California Highway 16 East/Jackson Road and travel for approximately 12 miles. Turn

right onto Dillard Road. In 1.7 miles, the PSA will be located at the southwest corner of Dillard Road and Meiss Road. The PSA can be accessed from gates off both Dillard Road and Meiss Road (Figure 2).

- Elevation Range- 95 to 160 feet above mean sea level (amsl)
- Average Elevation- 128 feet amsl
- PSA- 732.26 acres

---

# 3 Regulatory Setting

## 3.1 Federal

### 3.1.1 Clean Water Act: Section 404

Pursuant to Section 404 of the Clean Water Act, the U.S. Army Corps of Engineers (USACE) regulates the discharge of dredged and/or fill material into waters of the United States. Activities in waters for which a USACE permit may be required. Any person or public agency proposing to discharge dredged or fill material into waters of the United States, including jurisdictional wetlands, must obtain a Section 404 permit from USACE.

The wetlands determination process is initiated by submitting either an Approved Jurisdictional Determination or a Preliminary Jurisdiction Determination request along with an Aquatic Resources Delineation Report to determine if USACE-jurisdictional wetlands or other waters are present on the subject property. The wetland determination process is complete with the issuance of a written geographic jurisdictional determination verification from USACE. Compliance is required with Section 404 of the Clean Water Act (CWA) if a project activity will discharge dredged or fill materials to verified waters of the United States, including wetlands. The most common permits issued by the USACE Regulatory Program are Nationwide Permits covering certain activities identifies in the USACE regulations, and Individual Permits, intended for those projects that do not qualify for a nationwide permit.

The definition of waters of the United States establishes the geographic scope of the USACE jurisdiction under Section 404 of the CWA. On December 8, 2021, the U.S. Environmental Protection Agency (EPA) and USACE published in the Federal Register a proposed rule revising the definition of waters of the United States (86 Code of Federal Regulations [CFR] 69372-69450). This proposed rule would revise much of the 2020 Navigable Waters Protection Rule implemented during the Trump administration and restores the regulations in effect prior to the Obama Administration's 2015 Clean Water Rule. Moving forward, USACE and EPA propose to reinstate the pre-2015 definition of waters of the United States along with updates to reflect two notable Supreme Court decisions described in more detail below.

#### *Rapanos v. United States and Carabell v. United States*

In 2007 and again in 2008, USACE and EPA developed guidance for implementing the definition of waters of the United States under the CWA following the *Rapanos v. United States* and *Carabell v. United States* Supreme Court decision (EPA 2008). In accordance with both the original and revised guidance, jurisdiction over these waters will be as follows:

- Traditional navigable waters
- Wetlands adjacent to traditional navigable waters
- Non-navigable tributaries of traditional navigable waters that are relatively permanent (i.e., the tributaries typically flow year-round or have continuous flow at least seasonally)
- Wetlands that directly abut such tributaries

USACE will decide jurisdiction over the following waters based on a fact-specific analysis to determine whether they have a significant nexus with a traditional navigable water:

- Non-navigable tributaries that do not typically flow year-round or have continuous flow at least seasonally (i.e., ephemeral stream channels)
- Wetlands adjacent to such tributaries
- Wetlands adjacent to but that do not directly abut a relatively permanent non-navigable tributary

USACE will apply a significant nexus evaluation to potential waters of the United States as follows:

- A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by all wetlands adjacent to the tributary to determine if in combination they significantly affect the chemical, physical, and biological integrity of downstream traditional navigable waters
- Significant nexus includes consideration of hydrologic and ecologic factors including, but not limited to, volume, duration, and the frequency of surface water flow in the resource and its proximity to a traditional navigable water, and the functions performed by the resource on adjacent wetlands.

### *Solid Waste Agency of Northern Cook County v. USACE*

In 2001 and again in 2003, the agencies developed guidance to address the above definition of waters of the United States under the CWA following the *Solid Waste Agency of Northern Cook County v. USACE* U.S. Supreme Court Decision that “isolated, non-navigable, intrastate” waters could not be claimed as jurisdictional by USACE based on their use by migratory birds (EPA 2000). Although the Supreme Court did not specifically address the meaning of the word “isolated,” it upheld the above definition of “adjacent” wetlands (and other waters), which are by definition wetlands that are “bordering, contiguous, or neighboring” other jurisdictional waters. Therefore, the term “isolated wetland” has implicitly been defined as wetlands that are not bordering, contiguous, or neighboring other waters. The 2001 decision did not, however, define the term “adjacent,” nor did it state whether the basis for adjacency is geographic proximity or hydrology. As established by the Supreme Court in *United States v. Riverside Bayview Homes Inc.* in 1985, “wetlands separated from other waters by man-made dikes or barriers, natural river berms, beach dunes, and the like are ‘adjacent wetlands.’”

### Current (Proposed) Definition of Waters of the United States, Including Wetlands

As currently proposed by USACE and EPA, the term waters of the United States include the following (86 CFR 69372-69450):

1. All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;
2. All interstate waters including interstate wetlands;
3. “Other Waters” that meet either the “Relatively Permanent Standard” or the “Significant Nexus Standard”. All Other Waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, the use, degradation, or destruction of which could affect interstate or foreign commerce including any such waters:
  - a. Which are or could be used by interstate or foreign travelers for recreational or other purposes; or
  - b. From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or

- c. Which are used or could be used for industrial purposes by industries in interstate commerce;
  - d. All impoundments, and wetlands adjacent to impoundments, that meet either the Relatively Permanent Standard or the Significant Nexus Standard;
4. Tributaries of waters;
  5. The territorial seas; and
  6. Wetlands adjacent to waters (other than waters that are themselves wetlands); waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR 423.11(m) which also meet the criteria of this definition) are not waters of the U.S.

The Relatively Permanent Standard refers to waters that are relatively permanent, standing, or continuously flowing, and waters with a continuous surface connection to such waters. The Significant Nexus Standard refers to waters that either alone, or in combination with similarly situated waters in the region, significantly affect the chemical, physical, or biological integrity of traditional navigable waters, interstate waters, or the territorial seas (86 CFR 69372-69450).

Wetlands are “those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions” (33 CFR 328.3). USACE predominantly relies on the 1987 U.S. Army Corps of Engineers Wetlands Delineation Manual (USACE 1987) and the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region – Version 2.0 (USACE 2008a) methodology to determine the presence of jurisdictional wetlands in California. USACE relies on the presence of three criteria to determine if an area is a wetland: hydrophytic vegetation, hydric soils, and hydrology. Hydrophytic vegetation refers to a predominance of plant life that is adapted to life in wet conditions. Hydric soils refer to soils that saturate, flood, or pond long enough during the growing season to develop anaerobic conditions in the upper part. Lastly, hydrology refers to the presence of water, either above the soil surface or within the upper 12 to 18 inches of the soil profile just below the soil surface (USACE 2008a).

For linear, non-wetland waters of the United States (e.g., perennial, intermittent, or ephemeral drainages), the lateral limits of USACE jurisdiction extend to the reliable ordinary high water mark (OHWM). As defined in the CFR Title 33, Section 328.3(e), the OHWM is “that line on the shore established by the fluctuations of water and indicated by physical characteristics such as a clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas.” If wetlands are present adjacent to such resources and they meet the Relatively Permanent Standard or the Significant Nexus Standard, then jurisdiction would likely extend to the limit of these wetlands (86 CFR 69372-69450). Further guidance for determining jurisdictional limits in California is detailed in USACE’s *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (USACE 2008b).

## 3.2 Additional Regulatory Information

### 3.2.1 Agriculture and the Clean Water Act

Under the CWA, discharges of pollutants into waters of the United States are unlawful unless authorized by a permit. Section 404 permits authorize discharges of dredged or fill material into waters of the United States, including

wetlands. The USACE and the EPA are both responsible for implementing aspects of the CWA Section 404 permitting program. Most routine, on-going farming activities do not require CWA Section 404 permits. CWA Section 404(f) exempts normal farming, silviculture, and ranching from permitting requirements. However, if a farming activity is associated with bringing waters of the United States into a new use where the flow, circulation, or reach of that water might be affected (e.g., bringing a wetland into agricultural production or converting an agricultural wetland into a non-wetland area), the activity may require a permit (CRS 2020).

# 4 Methodology

## 4.1 Desktop Analysis

Prior to conducting fieldwork, Dudek reviewed the following available resources to identify portions of the PSA with a probability for containing potential jurisdictional aquatic resources:

- Antecedent Precipitation Tool (APT) (USACE 2020a).
- Federal Emergency Management Agency’s (FEMA) National Flood Hazard Layer (FEMA 2019).
- Google Earth current and historical aerial imagery (Google Earth 2020).
- Natural Resources Conservation Service Web Soil Survey (USDA 2020a).
- South Sacramento Habitat Conservation Plan (SSHCP) (County of Sacramento et. al. 2018).
- U.S. Fish and Wildlife Service National Wetlands Inventory (NWI) Mapper (USFWS 2020).
- U.S. Geological Survey Historical Topographical map data (USGS 2020a).
- U.S. Geological Survey National Hydrography Dataset (USGS 2020b).

## 4.2 Field Delineation

Dudek conducted a preliminary aquatic resources delineation of the approximately 732.26-acre PSA on October 27, 29, and 30, 2020; November 4 and 9–13, 2020; and March 3, 2021 (Table 2, Field Survey Schedule, Personnel, and Conditions).

**Table 2. Field Survey Schedule, Personnel, and Conditions**

| Date       | Hours                | Personnel                                       | Conditions                                    |
|------------|----------------------|-------------------------------------------------|-----------------------------------------------|
| 10/27/2020 | 8:00 a.m.- 4:00 p.m. | Laura Burris,<br>Allie Sennett,<br>Anna Godinho | 43 °F -73 °F; 0% cloud cover; 0-5 mph wind    |
| 10/28/2020 | 7:45 a.m.- 4:45 p.m. | Laura Burris,<br>Allie Sennett,<br>Anna Godinho | 40 °F -85 °F; 0% cloud cover; 0-3 mph wind    |
| 10/30/2020 | 7:30 a.m.-2:30 p.m.  | Laura Burris,<br>Anna Godinho                   | 41 °F -77 °F; 0% cloud cover; 0-3 mph wind    |

Potential modeled aquatic resources were delineated based on methodology described in the USACE *Wetland Delineation Manual* (USACE 1987) and the USACE *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (USACE 2008a). Non-Wetland Waters (NWW) of the U.S. were delineated based on the presence of an OHWM, as determined using the methodology in the USACE *Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (USACE 2008b). While in the field, aquatic resources were mapped and recorded using a digital collection application (Collector®) with sub-meter accuracy. All figures generated for this report follow the USACE *Updated Map and Drawing Standards for the South Pacific Division Regulatory Program* (USACE 2016). Representative photographs of the PSA are included in Appendix B, Photo Record.

All plant species encountered were identified to the lowest taxonomic level needed to determine wetland plant indicator status. Those species that could not be immediately identified were brought into the laboratory for further investigation. Latin names follow the Jepson Interchange “List of Currently Accepted Names of Native and Naturalized Plants of California” (Jepson Flora Project 2021), and common names follow the U.S. Department of Agriculture (USDA) NRCS “PLANTS” database (USDA 2021b). Wetland plant indicator status for each plant was determined using the National Wetland Plant List for the Arid West Region (USACE 2018). Appendix C, Observed Plant Species Compendium, contains a complete list of plant species observed during the field delineation.

Dudek took sample points on standardized Wetland Determination at resource locations to assess the potential for hydric soils, hydrology, and hydrophytic vegetation (see details in Section 4.2.1, Wetland Indicator Assessment). Data at representative stream transects were collected on standardized OHWM Datasheets to assess channel hydrology and geomorphology. Sample point Wetland Determination and OHWM Datasheets are included in this report as Appendix F, Datasheets. Wetland sample points and stream transects were recorded in the field using a Trimble R1 GNSS Receiver with sub-meter accuracy and ArcGIS Collector app for iOS. Results of the wetland sample points, and stream transect analyses are presented in Section 5.3, Sample Point and Transect Summary.

## 4.2.1 Wetland Indicator Assessment

Pursuant to the USACE protocols (USACE 1987; USACE 2008a), key explicit environmental criteria for determining the presence of potential jurisdictional aquatic resources in the PSA are as follows:

- **Soil-** Soil characteristics that result from the influence of periodic or permanent inundation or soil saturation for extended periods that further affect anaerobic conditions (i.e., chemical reduction in the soils or hydric soils).
- **Hydrology-** The presence of inundated or saturated soil conditions resulting from permanent or periodic inundation by groundwater or surface water.
- **Vegetation-** A prevalence of vegetation typically adapted for life in saturated soil conditions (i.e., hydrophytic vegetation).

Positive indicators of all three parameters are normally present in wetlands. Presence of primary and secondary wetland hydrology indicators were documented for each identified aquatic resource feature in the PSA. Potential jurisdictional wetlands exhibiting atypical conditions were delineated in accordance with USACE protocols (USACE 1987; USACE 2008a) for situations involving vegetation, soil, and hydrology that may be naturally problematic and/or significantly disturbed.

## 4.3 Ordinary High Water Mark Assessment

The U.S. Army Corps of Engineers Field Guide to the Identification of the Ordinary High Water Mark in the Arid West Region of the Western United States (USACE 2008b) was used to provide technical guidance for delineating the OHWM, which is based on the physical and biological signatures established and maintained at the boundaries of an active channel. The OHWM guide addresses the underlying hydrologic and geomorphic concepts pertaining to the OHWM and the field indicators, methods, and additional lines of evidence used to assess and delineate the OHWM. Delineation of the active channel signature (i.e., the OHWM) is based largely on identification of three primary physical or biological indicators (USACE 2008b):

- Topographic break in slope
- Change in sediment characteristics
- Change in vegetation characteristics (species or cover)

# 5 Results

## 5.1 Environmental Setting

The PSA is located within eastern Sacramento County at the eastern edge of the Central Valley, less than 15 miles from the western foothills of the Sierra Nevada Mountains. The PSA is less than 1 mile south of State Route 16 and approximately 18 miles southeast of the City of Sacramento. The PSA is surrounded by rural residential development and open space generally composed of annual grassland and agricultural fields. A retention basin complex associated with a caviar farming facility adjoins the Project to the north; the Cosumnes River adjoins the PSA to the west; and an existing solar development is located within the southeast corner of the PSA. An orchard is located across Dillard Road to the southeast. The PSA is primarily used for cattle grazing or other agricultural operations, and there is an existing solar facility (Figure 2).

### 5.1.1 Climate and Rainfall

The PSA is in a semi-arid climate where average annual temperatures range from approximately 53°F to 91°F, and the average annual precipitation is 18.15 inches. On average, the months with the highest rainfall are December and January, and July has the least precipitation (WRCC 2020).

According to data from the Sacramento WB City weather station, total precipitation recorded from October 1, 2019, through September 30, 2020, was 17.92 inches, approximately 61% of normal (CDEC 2020). Therefore, the Project region had below normal hydrological conditions in the year preceding the survey. The Sacramento WB City weather station is located approximately 18 miles west of the PSA at an elevation of approximately 25 feet amsl.

The USACE APT was used to assess the amount of precipitation received in the review area during the delineation (USACE 2020a). The tool calculated that the watersheds within the review area (sampled at Hydrologic Unit Code 8 geographic scope) experienced, on average, normal antecedent precipitation conditions on the dates that the delineation fieldwork was conducted (October 27 through November 13). The complete results of the APT query can be found in Appendix D, Antecedent Precipitation Tool Output.

### 5.1.2 Soil and Terrain

The PSA is in the eastern Central Valley. Elevations of the PSA range from approximately 95 feet amsl in the western portion of the PSA, to 160 feet amsl in the southeastern portion of the PSA.

According to the Natural Resources Conservation Service (USDA 2020a), 16 soil units were mapped within the PSA. Each soil unit, its proportion of hydric soils, drainage class (i.e., frequency and duration of wet periods in conditions like those in which it was developed), and typical landform or geomorphic position within the landscape is detailed in Table 3, Summary of Soil Units in the PSA below (Figure 3) (USDA 2020a).

Six of the 16 soil units identified in the PSA are listed as hydric soils. Hydric soils are defined by the National Technical Committee for Hydric Soils as soils that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part. Under natural conditions, these soils are either saturated or inundated long enough during the growing season to support the growth and reproduction of hydrophytic vegetation. Soils encountered during the field visits were generally clay to clay loam soils.

**Table 3. Summary of Soil Units Within the Project Study Area**

| Soil Map Unit Name                                   | Landform                       | Drainage Class                                | Hydric | Total Area (acres) |
|------------------------------------------------------|--------------------------------|-----------------------------------------------|--------|--------------------|
| Bruella sandy loam, 0%–2% slopes                     | Terraces                       | Well-drained                                  | No     | 2.44               |
| Bruella sandy loam, 2%–5% slopes                     | Terraces                       | Well-drained                                  | No     | 58.80              |
| Columbia sandy loam, 0%–2% slopes                    | Flood plains                   | Somewhat poorly drained, occasionally flooded | Yes    | 17.93              |
| Galt clay, 0%–1% slopes, MLRA 17                     | Basin floors on fan remnants   | Somewhat poorly drained                       | Yes    | 33.0               |
| Galt clay, 2%–5% slopes, MLRA 17                     | Basin floors on fan remnants   | Moderately well drained                       | Yes    | 126.62             |
| Hadselville-Pentz complex, 2%–30% slopes             | Hills                          | Moderately well drained to well drained       | No     | 226.32             |
| Peters clay, 1%–8% slopes                            | Hills                          | Well drained                                  | No     | 56.94              |
| Redding gravelly loam, 0%–8% slopes, MLRA 17         | Fan remnants                   | Moderately well drained                       | No     | 14.93              |
| Reiff fine sandy loam, 0%–2% slopes                  | Flood plains                   | Well drained, occasionally flooded            | No     | 96.11              |
| Sailboat silt loam, drained, 0%–2% slopes, MLRA 17   | Flood plains on natural levees | Somewhat poorly drained, occasionally flooded | Yes    | 3.50               |
| San Joaquin silt loam, 0%–3% slopes                  | Terraces                       | Moderately well drained                       | No     | 14.02              |
| San Joaquin silt loam, 0%–8% slopes                  | Terraces                       | Moderately well drained                       | No     | 52.45              |
| San Joaquin-Durixeralfs complex, 0%–1% slopes        | Terraces                       | Moderately well drained to well drained       | No     | 0.25               |
| San Joaquin-Galt complex, leveled, 0%–1% slopes      | Terraces                       | Moderately well drained                       | Yes    | 0.52               |
| San Joaquin-Galt complex, 0%–3% slopes               | Terraces                       | Moderately well drained                       | Yes    | 18.59              |
| San Joaquin-Xerarents complex, leveled, 0%–1% slopes | Terraces                       | Moderately well drained to well drained       | No     | 3.52               |

**Source:** USDA 2020c.

**Note:** MLRA = Major Land Resource Area.

<sup>1</sup> Hydric soil- defined by the USADA (i.e., formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part); if hydric conditions are present within the soil unit.

### 5.1.3 Watershed and Hydrology

The PSA occurs within the Upper Cosumnes River watershed, which drains approximately 180 square miles of land in El Dorado, Amador, and Sacramento Counties (Hydrological Unit Code 1804001306) (CDFW 2020). A complex

of seasonally inundated aquatic features generally drains the PSA in a southwesterly direction, and the Cosumnes River flows within the western boundary of the PSA. The western half of the PSA is located within the FEMA National Flood Hazard Layer 1% 100-year floodplain of the Cosumnes River (FEMA 2019). However, the portion of the Cosumnes River within the PSA is bounded by levees intended to contain the river and protect against overtopping during a normal rain year. The NWI maps numerous aquatic resources in the PSA, including Freshwater Emergent Wetland, Freshwater Forested/Shrub Wetland, Freshwater Pond, and Riverine (USFWS 2020). The NWI dataset is based on coarse aerial mapping (Figure 4).

Additionally, Appendix E, Land Cover Type Report for the SSHCP contains numerous other aquatic resources that were previously mapped within the PSA when the SSHCP was created (County of Sacramento et. al. 2018). The original SSHCP geographic model of aquatic resources, including vernal pool and swale land cover types, are based on interpretation of black and white aerial imagery dated March 2001. During SSHCP preparation, field surveys were conducted within selected parcels to provide recognition of signatures for aerial interpretation of the inaccessible portions field survey area. Those uncertain areas that were not contained in the field survey areas or easily identified from aerial photographs were spot-checked from public roads as feasible. The SSHCP identified individual vernal pool watershed boundaries using LIDAR data (i.e., County of Sacramento et. al. 2018 and flow modeling).

## 5.1.4 Vegetation Communities and Other Land Cover Types

Vegetation communities and land cover types within the PSA consist of a combination of terrestrial non-vegetative land covers and natural vegetation communities. The vegetation communities and land covers within the PSA were mapped using the SSHCP land cover data (County of Sacramento et. al. 2018). SSHCP vegetation communities and land cover types occurring within the PSA include agricultural, California annual grassland, low density development, mixed riparian forest, urban, valley foothill riparian, and valley grassland. A total of 75 species of native or naturalized plants—34 native (45%) and 41 non-natives (55%)—were recorded in the PSA during the field delineation (see Appendix C, Observed Plant Species Compendium).

### 5.1.4.1 Natural Vegetation Communities

#### California Annual Grassland and Valley Grassland

California annual grassland and valley grassland are the dominant vegetation community present in the PSA. Dominant species in this community include soft brome (*Bromus hordeaceus*), medusa head (*Elymus caput-medusae*), and narrow tarweed (*Holocarpha virgata*). The shrub and tree layers are absent from this vegetation community. There are numerous aquatic features that occur throughout the grassland.

#### Mixed Riparian Woodland and Valley Foothill Riparian

Mixed riparian woodland and valley foothill riparian comprise the riparian corridor adjacent to the Cosumnes River, a portion of which is located within the PSA. Valley oak (*Quercus lobata*) was the dominant overstory species, with a lesser abundance of Fremont's cottonwood (*Populus fremontii*), Goodding's black willow (*Salix gooddingii*), Northern California walnut (*Juglans hindsii*), and coast live oak (*Quercus agrifolia*). Shrubs occurred intermittently and included Himalayan blackberry (*Rubus armeniacus*), elderberry (*Sambucus* sp.), and California grape (*Vitis californica*). The herbaceous layer was dominated by disturbance-tolerant upland species, including yellow star-

thistle (*Centaurea solstitialis*), Italian plumeless thistle (*Carduus pycnocephalus*), and non-native grasses like those described for California annual grassland and valley grassland vegetation communities above.

#### 5.1.4.2 Other Land Cover Types

##### **Agricultural**

Agricultural land cover comprises a large field to the east of the Cosumnes River riparian corridor and levee. Land cover classified as agricultural typically includes lands where farming and other agricultural practices take place, including pastures (hay and alfalfa), row crops and other unidentified croplands.

##### **Low Density Development and Urban**

These land cover types include areas that have been completely altered by human activities and contain little to no vegetation. Such areas include buildings, paved and gravel roadways and trails, gravel lots, and other constructed environments. Low density development and urban areas within the PSA include two residences along Meiss Road and are primarily concentrated in the northwestern vicinity of the PSA.

## 5.2 Aquatic Resources Delineation Results

Ten aquatic resource types were documented in the PSA and are described in further detail below: freshwater emergent pond, seasonal wetland, vernal pool, ditch, ephemeral drainage, intermittent drainage, perennial drainage, seasonal wetland swale, and upland swale. Figure 5-1 through Figure 5-6).

### 5.2.1 Wetlands

#### 5.2.1.1 Freshwater Emergent Wetland

One freshwater emergent wetland comprising approximately 0.02 acres occurs in the southwest corner of the PSA artificially created by a broken bubbler sprinkler located on an adjacent property (see Photo 1 in Appendix B, Photo Record). This feature entirely occurs within the adjacent other lands within the PSA. This feature was saturated at the time of the field survey and supported emergent hydrophytic vegetation dominated by broadleaf cattail (*Typha latifolia*; obligate [OBL]) and Baltic rush (*Juncus balticus*; facultative wetland [FACW]). The wetland contained hydric soils as indicated by redox features (Hydric Soil Indicator F6), and wetland hydrology was confirmed by the presence of oxidized rhizosphere along living roots (Hydrology Indicator C3) and saturation (Hydrology Indicator A3). This feature is clearly the result of artificial irrigation and would likely convert to upland vegetation if the leakage was fixed.

#### 5.2.1.2 Pond

There are three ponds comprising approximately 17.01 acres within the PSA, of which 0.37 acres occur in the solar development area and 16.64 acres occur in the adjacent other lands. These features are natural closed depressions that have been artificially augmented by a perennial water source, generally for the purpose of supporting livestock. Pond-01 located within the western portion of the PSA (see Photo 4 in Appendix B, Photo Record) appears to have been created by an overflowing cattle trough and contained surface water (Hydrology

Indicator A1) at the time of the October/November field delineation. Pond-02 located within the eastern portion of the PSA appears to have been artificially supplemented by a well in the past as evidenced by inundation visible on aerial imagery (Hydrology Indicator B7) but was dry at the time of the October/November fieldwork. These two ponds contained hydric soils as indicated by redox features (Hydric Soil Indicator F3).

Pond-03 is a large feature that occurs along the western boundary of the central portion of the PSA and continues outside of the PSA to the west. Although this feature is classified by the NWI as a freshwater emergent wetland (USFWS 2020), the area was dry during the October/November field delineation and was actively being graded by heavy machinery. Pond-03 had been artificially excavated and leveled to several feet lower than the surrounding topography, with the soil stockpiled along the western boundary. Furthermore, during the March site revisit, Pond-03 was completely inundated and at full capacity. The southeastern boundary of the feature was mapped according to the extent of stinkwort (*Dittrichia graveolens*; upland [UPL]) growing within the basin margin. Pond-03 was mostly barren of vegetation due to the heavy livestock grazing and recent maintenance activities (see Photo 5 in Appendix B, Photo Record). Hydric soils were also absent, but wetland hydrology was confirmed by the presence of surface soil cracks (Hydrology Indicator B6) and inundation visible on aerial imagery, as recently as June 2020 (Google Earth 2020) (Hydrology Indicator B7). The current hydrology of Pond-03 is unknown; however, the basin appears to receive seasonal flows from the main drainage complexes on site to the southeast and northeast and may receive overflow from the Cosumnes River, located approximately 0.4 to 0.6 miles to the west and north.

### 5.2.1.3 Seasonal Wetland

There are 51 seasonal wetlands comprising approximately 14.16 acres throughout the PSA, of which 3.10 acres occur in the solar development area and 11.06 acres occur in the adjacent other lands. These features only appear to be inundated seasonally, and some are connected via seasonal wetland swales, ephemeral drainages, and/or intermittent drainages. Seasonal wetlands were characterized by a distinct change in vegetation type and cover from the surrounding grassland (see Photos 2 and 3 in Appendix B, Photo Record). The seasonal wetlands contain a dominance of facultative (FAC) grasses, including perennial rye grass (*Festuca perennis*) and mouse barley (*Hordeum marinum*). The wetlands contained hydric soils as indicated by depleted matrix, redox dark surface, and redox depressions (Hydric Soil Indicators F3, F6, and F8). Wetland hydrology was confirmed by the presence of oxidized rhizospheres along living roots, surface soil cracks, and/or saturation visible on aerial imagery (Hydrology Indicators C3, B6, and C9). Small mammal burrows were observed within several of the features, indicating that these features remained dry for a long enough period for subterranean animals to inhabit them. No surface water or saturation was present in the seasonal wetlands during the October/November 2020 fieldwork.

The seasonal wetland (i.e., SW-24) that is located downslope from a large linear agricultural irrigation system may have been artificially augmented by the irrigation system; however, it is still located within a natural depression within the landscape and further exhibits natural drainage patterns. This feature therefore meets the classification of an artificial irrigated wetland (i.e., “leaky ditch wetland”) because it would likely retain wetland parameters (i.e., hydrophytic vegetation, hydric soil, and hydrologic indicators) if the agricultural irrigation operations were to cease. This feature does not meet the criteria to be classified as a “prior converted cropland.”

### 5.2.1.4 Vernal Pool

There are 17 vernal pools comprising approximately 6.30 acres within the PSA, of which 0.25 acres occur in the solar development area and 6.04 acres occur in the adjacent other lands. These features were characterized as

three-parameter wetlands with an impermeable layer such as a hard pan that may fill and empty several times during the rainy season. These features may be isolated or connected to larger vernal complexes via swales. The vernal pools on site exhibited concentric rings of distinctly different vegetation cover and species composition (see Photo 6 in Appendix B, Photo Record), the center of which was generally devoid of vegetation due to prolonged inundation and surrounded by a predominance of hydrophytic species such as Great Valley eryngo (*Eryngium castrense*; OBL), prostrate knotweed (*Polygonum aviculare*; FACW), turkey tangle fog fruit (*Phyla nodiflora*; FACW), and bracted popcorn flower (*Plagiobothrys bracteatus*; FACW), as well as facultative grasses growing along the feature margins. The vernal pools contained hydric soils as indicated by depleted matrix, redox dark surface, and redox depressions (Hydric Soil Indicators F3, F6, and F8). Wetland hydrology was confirmed by the presence of oxidized rhizospheres along living roots and surface soil cracks (Hydrology Indicators C3 and B6). No surface water or saturation was present in the vernal pools during the October/November 2020 fieldwork. Inundation was visible on aerial imagery during wet years (i.e., 2006, 2011) (Google Earth 2020) (Hydrology Indicator B7), and cow punches and evidence of grazing were documented in most of the vernal pools on site.

## 5.2.2 Non-Wetland Waters

### 5.2.2.1 Ditch

There are four ditches comprising approximately 1.93 acres (5,105.55 linear feet) throughout the PSA, of which 0.15 acre (720.26 linear feet) is within the solar development area, and 1.78 acres (4,385.29 linear feet) are within the adjacent other lands of the PSA. The earthen ditches are human-made features with intermittent hydrology intended for stormwater, agricultural, irrigation, runoff, or similar purposes. Evidence of an OHWM within the ditches includes a break in slope, bed and bank, and change in plant community, and deposition within Ditch-02. Ditch-01 supports emergent vegetation along the bank margins, including perennial rye grass, mouse barley, soft rush (*Juncus effusus*; FACW), and Valley oak and Goodding's willow saplings. Ditch-02 supports upland vegetation along the banks including fennel (*Foeniculum vulgare*; UPL) and perennial pepperweed (*Lepidium latifolium*; UPL) (see Photo 7 in Appendix B, Photo Record). Ditch-01 continues north at the southeastern corner of the PSA, but the bed and bank dissipate along the eastern boundary. The current use of Ditch-01 is unclear, and parts of the feature were being used as a livestock pen at the time of the fieldwork. Ditches 03 and D-04 are connected hydrologically via culverts and run parallel on the east and west sides of Dillard Road at the existing solar facility within the PSA. Dominant species present within the drainages D-03 and D-04 include ripgut brome (*Bromus diandrus*), wild oats (*Avena fatua*), and Medusa head (*Elymus caput-medusae*), all of which are not listed with indicators by the USACE. Although inundation is visible on aerial imagery (Hydrology Indicator B7) (Google Earth 2020), all ditches were dry during the October/November and March field delineation. There is no continuous riparian corridor associated with the features in the PSA.

### 5.2.2.2 Ephemeral Drainage

There are four ephemeral drainages comprising approximately 1.11 acres (3,431.84 linear feet) within the PSA, of which 0.74 acres (2,439.08 linear feet) occur in the solar development area and 0.37 acres (992.76 linear feet) occur in the adjacent other lands. Ephemeral drainages on site consist of stream channels that are naturally occurring rather than anthropogenically created, and contain flowing water during, and for a short duration after, precipitation events. Hydrology of the ephemeral drainages is dependent on inputs during rain events and runoff from the surrounding uplands, with evidence of OHWM including shelving, a break in slope, sediment sorting, bed and bank, bent vegetation, and/or a change in plant community and cover (see Photo 8 in Appendix B, Photo

Record). Where vegetation was present, the ephemeral drainages contained a dominance of hydrophytic species like those described for seasonal wetlands and vernal pools. These drainages flow in a southwesterly direction and terminate into Pond-03 via culverts. These drainages were dry at the time of the October/November 2020 fieldwork. There are no continuous riparian corridors associated with these features in the PSA.

### 5.2.2.3 Intermittent Drainage

One intermittent drainage comprising approximately 2.36 acres (4,462.81 linear feet) within the PSA, of which 0.46 acres (1,303.60 linear feet) occur in the solar development area and 1.91 acres (3,159.21 linear feet) occur in the adjacent other lands. Intermittent drainages generally have flowing water during certain times of the year, when groundwater provides water for stream flow, and receive supplemental water from rainfall runoff. The intermittent drainage on site appears to receive water via a culvert from a basin complex located north of the PSA. Evidence of an OHWM and presence of hydrophytic vegetation is like that described for ephemeral drainages above (see Photo 9 in Appendix B, Photo Record); however, the feature exhibits a mild break in slope and lacks a defined bed and bank in places. The drainage receives water from two adjacent seasonal wetland swales, contains three seasonal wetlands within low points or widenings, and terminates into Pond-03. Although inundation is visible on aerial imagery, this drainage was dry at the time of the October/November fieldwork.

### 5.2.2.4 Perennial Drainage (Cosumnes River)

The northwestern portion of the PSA contains 24.10 acres (4,506.29 linear feet) of the Cosumnes River and its associated riparian corridor (previously described in Section 5.1.4). This feature entirely occurs within the adjacent other lands within the PSA. The Cosumnes River is a known jurisdictional water with perennial flows that originates in the Sierra Nevada mountains and flows approximately 50 miles into the Central Valley, emptying into the Mokelumne River in the Sacramento San Joaquin Delta. The riverbed consists of granite slabs and unconsolidated sand beaches. The OHWM of the river was mapped based on the presence of wracking, sediment sorting, shelving, and a change in vegetation type and cover. The top of bank (TOB) was delineated using 2-foot-wide topographic contours, and the extent of riparian woodland, where present beyond TOB, was mapped to the dripline of riparian vegetation. The river contained flowing water at an estimated depth of 10 feet during the October/November fieldwork (see Photo 10 in Appendix B, Photo Record).

### 5.2.2.5 Seasonal Wetland Swale

There are 15 seasonal wetland swales comprising approximately 2.15 acres (8,807.17 linear feet) within the PSA, of which 3.10 acres occur in the solar development area and 11.06 acres occur in the adjacent other lands. Seasonal wetland swales on site consist of topographic depressions that would be expected to convey water when inundated, but where a defined bed and bank and typical fluvial indicators are lacking (see Photo 11 in Appendix B, Photo Record). These features were generally delineated by a mild break in slope and change in vegetation type and cover. These features were dominated by facultative wetland grasses like those described for seasonal wetlands above. All swales on site were dry at the time of the October/ November 2020 fieldwork.

### 5.2.2.6 Upland Swale

There are seven upland swales comprising approximately 0.62 acres (1,837.54 linear feet) within the PSA, of which 0.08 acres (923.59 linear feet) occur in the solar development area and 816 linear feet 0.54 acres (811.44 linear

feet) occur in the adjacent other lands. Upland swales on site consisted of linear topographic depressions that lack a distinct OHWM. These features contain a mild break in slope and a slight change in vegetation type and cover but did not support a dominance of wetland vegetation (see Photo 12 in Appendix B, Photo Record). These features contained upland grasses and facultative wetland grasses, like those described for annual grassland and seasonal wetlands above.

### 5.3 Sample Point and Transect Summary

Results from observable field indicators from 191 wetland data points and 48 stream transects indicate that approximately 69.77 acres of aquatic resources occur on the PSA (Figure 5-1 through Figure 5-6). The data collected at each data point and transect are included in Appendix E and summarized in Tables 4, Wetland Data Point Summary and Table 5, Ordinary High-Water Mark Transect Data Summary.

**Table 4. Wetland Data Point Summary**

| Data Point | Wetland Determination Field Indicators |       |           | Location (Decimal Degrees- Latitude, Longitude) | Determination |
|------------|----------------------------------------|-------|-----------|-------------------------------------------------|---------------|
|            | Vegetation                             | Soils | Hydrology |                                                 |               |
| 1          | Yes                                    | Yes   | Yes       | 38.4754186330251°, -121.174582691202°           | SW-01         |

# 6 Conclusion

## 6.1 Summary of Delineation Results

Based on all the data collected during the field delineation, Dudek determined that approximately 69.76 acres (28,152.21 linear feet) of combined wetlands and NWW aquatic resources occur on the PSA (Table 6). This includes the following wetland features: freshwater emergent wetland (0.02 acre), pond (17.01 acres), seasonal wetland (14.16 acres), and vernal pool (6.30 acres); and the following NWWs: ditch 1.93 acres (4,385.29 linear feet), ephemeral drainage 1.11 acres (3,431.84 linear feet), intermittent drainage 2.36 acres (4,462.81 linear feet), perennial drainage (i.e., the Cosumnes River) 24.10 acres (4,506.29 linear feet), seasonal wetland swale 2.15 acres (8,807.18 linear feet), and upland swale 0.63 acres (1,837.55 linear feet) (See Table 1, Summary of Aquatic Resources within the Project Study Area).

## 6.2 Summary of Aquatic Resources within the Solar Development Area of The Project Study Area

Furthermore, Dudek has determined that approximately 5.85 acres of combined wetlands and NWW aquatic resources occur within the solar development area of the PSA based on the final preferred environmental alternative site plan dated June 2022 (DESRI 2022) (see below Table 6. Summary of Aquatic Resources within the Solar Development Area and Adjacent Other Lands of the Project Study Area).

**Table 6. Summary of Aquatic Resources within the Solar Development Area and Adjacent Other Lands of the PSA.**

| Aquatic Resource Feature      | Aquatic Resource Type | Total Acreage |
|-------------------------------|-----------------------|---------------|
| <b>Solar Development Area</b> |                       |               |
| Ditch                         | NWW                   | 0.15          |
| Ephemeral Drainage            | NWW                   | 0.74          |
| Intermittent Drainage         | NWW                   | 0.46          |
| Seasonal Wetland Swale        | NWW                   | 0.70          |
| Upland Swale                  | NWW                   | 0.08          |
| Pond                          | Wetlands              | 0.37          |
| Seasonal Wetland              | Wetlands              | 3.10          |
| Vernal Pool                   | Wetlands              | 0.25          |
|                               | <i>Sub-Total</i>      | 5.85          |
| <b>Adjacent Other Lands</b>   |                       |               |
| Ditch                         | NWW                   | 1.78          |
| Ephemeral Drainage            | NWW                   | 0.37          |
| Intermittent Drainage         | NWW                   | 1.91          |
| Perennial Drainage            | NWW                   | 24.10         |
| Seasonal Wetland Swale        | NWW                   | 1.45          |

**Table 6. Summary of Aquatic Resources within the Solar Development Area and Adjacent Other Lands of the PSA.**

| Aquatic Resource Feature    | Aquatic Resource Type | Total Acreage |
|-----------------------------|-----------------------|---------------|
| Upland Swale                | NWW                   | 0.54          |
| Freshwater Emergent Wetland | Wetlands              | 0.02          |
| Pond                        | Wetlands              | 16.64         |
| Seasonal Wetland            | Wetlands              | 11.06         |
| Vernal Pool                 | Wetlands              | 6.04          |
|                             | <i>Sub-Total</i>      | 63.90         |
|                             | <b>Total</b>          | <b>69.75</b>  |

A summary of individual aquatic resources and their location of occurrence within the PSA (i.e., within the solar development area or within the adjacent other lands) is provided below in Table 7. Summary of Individual Aquatic Resources Features in the Project Study Area. Additionally, in accordance with the *USACE Sacramento District Minimum Standards for Acceptance of Aquatic Resources Delineation Reports* (USACE 2016), the completed Aquatic Resources Excel Spreadsheet is provided in Appendix E, Aquatic Resources Spreadsheet, and a compilation of shapefiles are provided as electronic files. Lastly, See Section 7 Discussion for a complete preliminary jurisdictional assessment of aquatics resources within the PSA.

**Table 7. Summary of Individual Aquatic Resource Features in the Project Study Area**

| Feature ID <sup>1</sup> | Cowardin Code <sup>2</sup> | Location (Decimal Degrees-Latitude, Longitude) | PSA – Adjacent Other Lands |             | PSA – Solar Development Area |             | PSA   |             |

## 7 Discussion

This report preliminarily identifies all aquatic resources within the solar development area of the PSA as Waters of the United States, meeting the criteria of waters of the United States pursuant to regulations in Section 404 of the CWA (Appendix E, USACE Aquatic Resources Spreadsheet).

A total of 5.85 acres (9,260.86 linear feet) of waters of the United States specifically occur within the solar development area of the PSA based on the final preferred environmental alternative site plan dated June 2022 (DESRI 2022). This includes the following resource totals for wetlands: 0.37 acre of ponds, 3.10 acres of seasonal wetlands, and 0.25 acre of vernal pools; as well as the following totals for NWWs: 0.15 acre (923.59 linear feet) of ditches, 0.74 acre (2,439.08 linear feet) of ephemeral drainages, 0.46 acre (1,303.60 linear feet) of intermittent drainages, 0.70 acre (3,874.33 linear feet) of seasonal wetland swales, and 0.08 acre (923.59 linear feet) of upland swales. No perennial drainages or freshwater emergent wetlands occur within the solar development area of the PSA. As outlined in Section 3.1, aquatic resources within the PSA were preliminary identified as Waters of the United States based on the current USACE definition (e.g., meet the relatively permanent standard and/or may have a significant nexus). The jurisdictional determinations for aquatic resources delineated in the PSA are preliminary until verified by the USACE Sacramento District.

## Request for Aquatic Resources Delineation Verification of Jurisdictional Determination

**REQUEST FOR AQUATIC RESOURCES DELINEATION VERIFICATION**  
**OR JURISDICTIONAL DETERMINATION**

A separate jurisdictional determination (JD) is not necessary to process a permit. An Approved Jurisdictional Determination (AJD) is required to definitively determine the extent of waters of the U.S. and is generally used to disclaim jurisdiction over aquatic resources that are not waters of the U.S., in cases where the review area contains no aquatic resources, and in cases when the recipient wishes to challenge the water of the U.S. determination on appeal. Either an Aquatic Resources Delineation Verification or a Preliminary Jurisdictional Determination (PJD) may be used when the recipient wishes to assume that aquatic resources are waters of the U.S. for the purposes of permitting. In some circumstances an AJD may require more information, a greater level of effort, and more time to produce. If you are unsure which product to request, please speak with your project manager or call the Sacramento District's general information line at (916) 557-5250.

I am requesting the product indicated below from the U.S. Army Corps of Engineers, Sacramento District, for the review area located at:

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                               |

**\*Authorities:** Rivers and Harbors Act, Section 10, 33 USC 403; Clean Water Act, Section 404, 33 USC 1344; Marine Protection, Research, and Sanctuaries Act, Section 103, 33 USC 1413; Regulatory Program of the U.S. Army Corps of Engineers; Final Rule for 33 CFR Parts 320-332.

**Principal Purpose:** The information that you provide will be used in evaluating your request to determine whether there are any aquatic resources within the project area subject to federal jurisdiction under the regulatory authorities referenced above.

**Routine Uses:** This information may be shared with the Department of Justice and other federal, state, and local government agencies, and the public, and may be made available as part of a public notice as required by federal law. Your name and property location where federal jurisdiction is to be determined will be included in the approved jurisdictional determination (AJD), which will be made available to the public on the District's website and on the Headquarters USACE website.

**Disclosure:** Submission of requested information is voluntary; however, if information is not provided, the request for an AJD cannot be evaluated nor can an AJD be issued.

## Photo Record

Photo 1: Freshwater Emergent Wetland (FEW)-01.

Photo 2: Representative photo of a seasonal wetland (SW-03) on site.

**Photo 3:** Another representative photo of a seasonal wetland (SW-33) on site.

**Photo 4:** Representative photo of a pond (Pond-01) on site.

Photo 5: Pond-03 (pictured) was actively being graded during the October/November field surveys.

Photo 6: Representative photo of a vernal pool (VP-07) on site showing the concentric rings of hydrophytic vegetation.

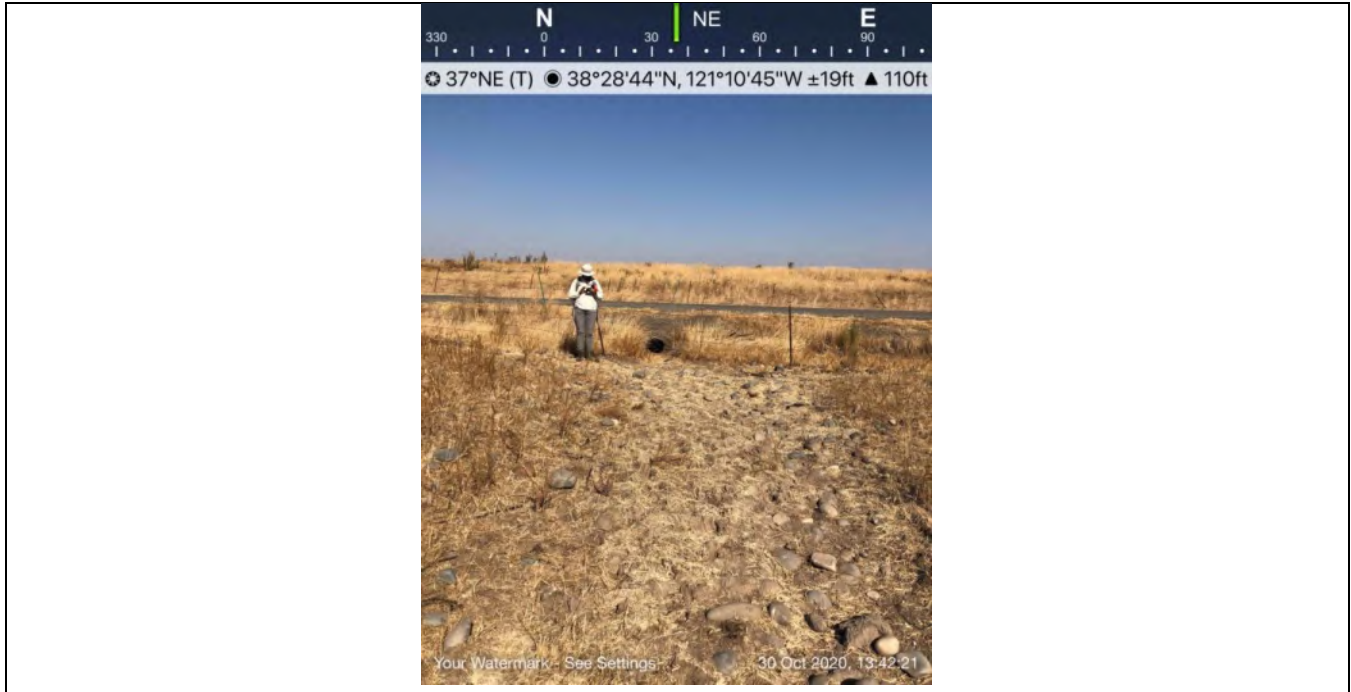

**Photo 7:** Representative photo of Ditch-02, which was inundated at the time of the October/November field survey and contained mostly upland vegetation.

**Photo 8:** Representative photo of an ephemeral drainage (ED-02) on site.

**Photo 9:** The intermittent drainage (ID-01) on site at its intersection with Meiss Road.

**Photo 10:** A portion of the Cosumnes River (Perennial Drainage-01) flows within the western boundary of the project site.

**Photo 11:** Representative photo of a seasonal wetland swale (SWS-06) on site.

**Photo 12:** Representative photo of an upland swale (US-04) on site.

---

# **Appendix C**

## Observed Plant Species Compendium

# VASCULAR SPECIES

## EUDICOTS

### ADOXACEAE—MUSKROOT FAMILY

*Sambucus nigra*—blue elderberry

### AMARANTHACEAE—AMARANTH FAMILY

\* *Amaranthus albus*—prostrate pigweed

### APIACEAE—CARROT FAMILY

- \* *Conium maculatum*—poison hemlock
- \* *Eryngium castrense*—Great Valley eryngo
- \* *Foeniculum vulgare*—fennel
- \* *Torilis arvensis*—spreading hedgeparsley

### ASTERACEAE—SUNFLOWER FAMILY

- Baccharis pilularis*—coyote brush
- \* *Carduus pycnocephalus*—Italian plumeless thistle
- \* *Centaurea solstitialis*—yellow star-thistle
- \* *Dittrichia graveolens*—stinkwort
- \* *Erigeron canadensis*—Canadian horseweed
- Holocarpha virgata*—yellowflower tarweed
- \* *Hypochaeris glabra*—smooth cat's ear
- \* *Hypochaeris radicata*—hairy cat's ear
- \* *Lactuca serriola*—prickly lettuce
- \* *Matricaria discoidea*—disc mayweed
- Psilocarphus brevissimus*—short woollyheads
- \* *Sonchus arvensis*—field sowthistle
- \* *Xanthium strumarium*—cocklebur

### BORAGINACEAE—BORAGE FAMILY

*Plagiobothrys bracteatus*—bracted popcornflower

### BRASSICACEAE—MUSTARD FAMILY

- \* *Brassica nigra*—black mustard
- \* *Lepidium latifolium*—perennial pepper weed

### CARYOPHYLLACEAE—PINK FAMILY

- \* *Spergularia rubra*—red sandspurry

**CONVOLVULACEAE—MORNING-GLORY FAMILY**

- \* *Convolvulus arvensis*—field bindweed

**CUCURBITACEAE—GOURD FAMILY**

*Cucurbita foetidissima*—Missouri gourd

**EUPHORBIACEAE—SPURGE FAMILY**

*Croton setiger*—dove weed

**FABACEAE—LEGUME FAMILY**

*Lupinus microcarpus*—valley lupine

- \* *Trifolium hirtum*—rose clover

**FAGACEAE—OAK FAMILY**

*Quercus agrifolia*—coast live oak

*Quercus lobata*—valley oak

**GERANIACEAE—GERANIUM FAMILY**

- \* *Erodium botrys*—longbeak stork's bill

- \* *Erodium cicutarium*—redstem stork's bill

**JUGLANDACEAE—WALNUT FAMILY**

*Juglans hindsii*—Northern California black walnut

**LAMIACEAE—MINT FAMILY**

*Trichostema lanceolatum*—vinegarweed

**LYTHRACEAE—LOOSESTRIFE FAMILY**

- \* *Lythrum hyssopifolia*—hyssop loosestrife

**MALVACEAE—MALLOW FAMILY**

- \* *Malva parviflora*—cheeseweed mallow

**ONAGRACEAE—EVENING PRIMROSE FAMILY**

*Epilobium brachycarpum*—tall annual willowherb

*Epilobium ciliatum*—fringed willowherb

**POLYGONACEAE—BUCKWHEAT FAMILY**

- \* *Polygonum aviculare*—prostrate knotweed

- \* *Rumex crispus*—curly dock

- \* *Rumex dentatus*—toothed dock

- \* *Rumex pulcher*—fiddle dock

### RANUNCULACEAE—BUTTERCUP FAMILY

*Ranunculus aquatilis*—white water crowfoot

*Ranunculus sceleratus*—cursed buttercup

### ROSACEAE—ROSE FAMILY

\* *Rubus armeniacus*—Himalayan blackberry

### SALICACEAE—WILLOW FAMILY

*Populus fremontii*—Fremont cottonwood

*Salix gooddingii*—Goodding's willow

### SOLANACEAE—NIGHTSHADE FAMILY

\* *Solanum elaeagnifolium*—silverleaf nightshade

### VERBENACEAE—VERVAIN FAMILY

*Phyla nodiflora*—turkey tangle fogfruit

### VITACEAE—GRAPE FAMILY

*Vitis californica*—California wild grape

## MONOCOTS

### CYPERACEAE—SEDGE FAMILY

*Cyperus eragrostis*—tall flatsedge

*Eleocharis macrostachya*—pale spike rush

### JUNCACEAE—RUSH FAMILY

*Juncus balticus*—no common name

*Juncus effusus*—soft rush

### POACEAE—GRASS FAMILY

*Alopecurus saccatus*—Pacific foxtail

\* *Avena barbata*—slender oat

\* *Avena fatua*—wild oat

\* *Briza minor*—little quakinggrass

\* *Bromus diandrus*—ripgut brome

\* *Bromus hordeaceus*—soft brome

\* *Crypsis schoenoides*—swamp pricklegrass

\* *Cynodon dactylon*—Bermudagrass

\* *Elymus caput-medusae*—medusahead

\* *Festuca myuros*—rat-tail fescue

\* *Festuca perennis*—perennial rye grass

- \* *Gastridium phleoides*—nit grass
- \* *Hordeum marinum*—seaside barley
- \* *Hordeum murinum*—mouse barley
- \* *Melica californica*—California melicgrass
- \* *Phalaris aquatica*—Harding grass
- \* *Poa secunda*—onesided bluegrass
- \* *Polypogon monspeliensis*—annual rabbitsfoot grass

#### THEMIDACEAE—BRODIAEA FAMILY

*Brodiaea elegans*—harvest brodiaea

*Triteleia laxa*—Ithuriel's spear

#### TYPHACEAE—CATTAIL FAMILY

*Typha latifolia*—broadleaf cattail

- \* signifies introduced (non-native) species

## Datasheets

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/27/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 1  
 Investigator(s): A, Sennett, A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): Flatlands Local relief (concave, convex, none): Concave Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.47541863 Long: -121.1745827 Datum: WGS84  
 Soil Map Unit Name: Galt clay, 2 - 5% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/27/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 2  
 Investigator(s): A, Sennett, A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): Flatland Local relief (concave, convex, none): none Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.47540505 Long: -121.1745692 Datum: WGS84  
 Soil Map Unit Name: Galt clay, 2 - 5% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/27/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 3  
 Investigator(s): A, Sennett, A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): Flatland Local relief (concave, convex, none): Concave Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.47523757 Long: -121.1747089 Datum: WGS84  
 Soil Map Unit Name: Galt clay, 2 - 5% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/27/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 4  
 Investigator(s): A, Sennett, A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): Flatlands Local relief (concave, convex, none): none Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.47524044 Long: -121.174652 Datum: WGS84  
 Soil Map Unit Name: Galt clay, 2 - 5% slopes NWI classification: na

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/27/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 5  
 Investigator(s): A, Sennett and A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): Flatlands Local relief (concave, convex, none): None Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.47489308 Long: -121.1749057 Datum: WGS84  
 Soil Map Unit Name: Galt clay, 2 - 5% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil , or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/27/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 6  
 Investigator(s): A, Sennett, A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): Flatland Local relief (concave, convex, none): none Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.47494863 Long: -121.1745465 Datum: WGS84  
 Soil Map Unit Name: Galt clay, 2 - 5% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes  No \_\_\_\_\_  
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

## WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/27/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 7  
 Investigator(s): A, Sennett, A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): flatland Local relief (concave, convex, none): Concave Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.47450824 Long: -121.1744418 Datum: WGS84  
 Soil Map Unit Name: Galt clay, 2 - 5% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

### SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

**Hydrophytic Vegetation Indicators:**  
 Dominance Test is >50%  
 Prevalence Index is ≤3.0<sup>1</sup>  
 Morphological Adaptations<sup>1</sup> (Provide supporting data in Remarks or on a separate sheet)  
 Problematic Hydrophytic Vegetation<sup>1</sup> (Explain)

<sup>1</sup>Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes  No \_\_\_\_\_

Remarks:  
 Change in vegetation cover/ composition

**SOIL**

Sampling Point: 7

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/27/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 8  
 Investigator(s): A, Sennett, A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): Flatlands Local relief (concave, convex, none): concave Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.47444778 Long: -121.1753235 Datum: WGS84  
 Soil Map Unit Name: Galt clay, 2 - 5% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

<sup>1</sup>Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes  No \_\_\_\_\_

Remarks:  
 Change in vegetation cover/ composition

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/27/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 9  
 Investigator(s): A, Sennett, A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): Flatland Local relief (concave, convex, none): Concave Slope (%): 0  
 Subregion (LRR): C Lat: 38.4742124 Long: -121.174705 Datum: WGS84  
 Soil Map Unit Name: Galt clay, 2 - 5% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No  (If no, explain in Remarks.)  
 Are Vegetation , Soil , or Hydrology  significantly disturbed? Are "Normal Circumstances" present? Yes  No   
 Are Vegetation , Soil , or Hydrology  naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

Hydrophytic Vegetation Present? Yes  No

<sup>1</sup>Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/27/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 10  
 Investigator(s): A. Sennet and A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): flatlands Local relief (concave, convex, none): concave Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.47436035 Long: -121.1748463 Datum: WGS84  
 Soil Map Unit Name: Galt clay, 2 - 5% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/27/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 11  
 Investigator(s): A. Sennet and A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): flatlands Local relief (concave, convex, none): concave Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.47404942 Long: -121.1745257 Datum: WGS84  
 Soil Map Unit Name: Galt clay, 2 - 5% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

## WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/27/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 12  
 Investigator(s): A. Sennet and A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): flatlands Local relief (concave, convex, none): none Slope (%): 0  
 Subregion (LRR): Galt clay, 2 - 5% slopes Lat: 38.47404197 Long: -121.1745408 Datum: WGS84  
 Soil Map Unit Name: TBD NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No  (If no, explain in Remarks.)  
 Are Vegetation , Soil , or Hydrology  significantly disturbed? Are "Normal Circumstances" present? Yes  No   
 Are Vegetation , Soil , or Hydrology  naturally problematic? (If needed, explain any answers in Remarks.)

### SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/27/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 13  
 Investigator(s): A, Sennett and A. Godinho Section, Township, Range: TBD  
 Landform (hillslope, terrace, etc.): Flatlands Local relief (concave, convex, none): concave Slope (%): 1  
 Subregion (LRR): C Lat: 38.47410807 Long: -121.1732138 Datum: WGS84  
 Soil Map Unit Name: Galt clay, 2 - 5% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No  (If no, explain in Remarks.)  
 Are Vegetation , Soil , or Hydrology  significantly disturbed? Are "Normal Circumstances" present? Yes  No   
 Are Vegetation , Soil , or Hydrology  naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/28/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 14  
 Investigator(s): L. Burris, A. Sennet, A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): bottomland Local relief (concave, convex, none): concave Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.47401179 Long: -121.1742674 Datum: WGS84  
 Soil Map Unit Name: Galt Clay, 2-5% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/28/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 15  
 Investigator(s): L. Burris, A. Sennet, A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): flatland Local relief (concave, convex, none): none Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.47403752 Long: -121.1742239 Datum: WGS84  
 Soil Map Unit Name: Galt clay, 2 - 5% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/28/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 16  
 Investigator(s): L. Burris, A. Sennet, A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): flatlands Local relief (concave, convex, none): concave Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.47383624 Long: -121.1739205 Datum: WGS84  
 Soil Map Unit Name: Galt clay, 2 - 5% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

**Dominance Test worksheet:**  
 Number of Dominant Species That Are OBL, FACW, or FAC: 2 (A)  
 Total Number of Dominant Species Across All Strata: 2 (B)  
 Percent of Dominant Species That Are OBL, FACW, or FAC: 100 (A/B)

**Prevalence Index worksheet:**  
 Total % Cover of: \_\_\_\_\_ Multiply by: \_\_\_\_\_  
 OBL species \_\_\_\_\_ x 1 = \_\_\_\_\_  
 FACW species \_\_\_\_\_ x 2 = \_\_\_\_\_  
 FAC species \_\_\_\_\_ x 3 = \_\_\_\_\_  
 FACU species \_\_\_\_\_ x 4 = \_\_\_\_\_  
 UPL species \_\_\_\_\_ x 5 = \_\_\_\_\_  
 Column Totals: \_\_\_\_\_ (A) \_\_\_\_\_ (B)  
 Prevalence Index = B/A = \_\_\_\_\_

**Hydrophytic Vegetation Indicators:**  
 Dominance Test is >50%  
 Prevalence Index is ≤3.0<sup>1</sup>  
 Morphological Adaptations<sup>1</sup> (Provide supporting data in Remarks or on a separate sheet)  
 Problematic Hydrophytic Vegetation<sup>1</sup> (Explain)

<sup>1</sup>Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes  No \_\_\_\_\_

Remarks:  
 Thatch layer

**SOIL**

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/28/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 17  
 Investigator(s): L. Burris, A. Sennet, A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): flatland Local relief (concave, convex, none): concave Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.4738083 Long: -121.1739917 Datum: WGS84  
 Soil Map Unit Name: Galt clay, 2 - 5% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

**Dominance Test worksheet:**  
 Number of Dominant Species That Are OBL, FACW, or FAC: 2 (A)  
 Total Number of Dominant Species Across All Strata: 2 (B)  
 Percent of Dominant Species That Are OBL, FACW, or FAC: 100 (A/B)

**Prevalence Index worksheet:**  
 Total % Cover of: \_\_\_\_\_ Multiply by: \_\_\_\_\_  
 OBL species \_\_\_\_\_ x 1 = \_\_\_\_\_  
 FACW species \_\_\_\_\_ x 2 = \_\_\_\_\_  
 FAC species \_\_\_\_\_ x 3 = \_\_\_\_\_  
 FACU species \_\_\_\_\_ x 4 = \_\_\_\_\_  
 UPL species \_\_\_\_\_ x 5 = \_\_\_\_\_  
 Column Totals: \_\_\_\_\_ (A) \_\_\_\_\_ (B)  
 Prevalence Index = B/A = \_\_\_\_\_

**Hydrophytic Vegetation Indicators:**  
 Dominance Test is >50%  
 Prevalence Index is ≤3.0<sup>1</sup>  
 Morphological Adaptations<sup>1</sup> (Provide supporting data in Remarks or on a separate sheet)  
 Problematic Hydrophytic Vegetation<sup>1</sup> (Explain)

<sup>1</sup>Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes  No \_\_\_\_\_

Remarks:

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/28/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 18  
 Investigator(s): L. Burris, A. Sennet, A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): flatland Local relief (concave, convex, none): none Slope (%): 0  
 Subregion (LRR): C Lat: 38.47379357 Long: -121.1740404 Datum: WGS84  
 Soil Map Unit Name: Galt clay, 2 - 5% slopes NWI classification: TBD

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No  (If no, explain in Remarks.)  
 Are Vegetation , Soil , or Hydrology  significantly disturbed? Are "Normal Circumstances" present? Yes  No   
 Are Vegetation , Soil , or Hydrology  naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/28/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 19  
 Investigator(s): A, Sennett and A. Godinho, L. Burris Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): Flatland Local relief (concave, convex, none): Concave Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.47333069 Long: -121.1724767 Datum: WGS84  
 Soil Map Unit Name: San Joaquin-Galt complex, 0 - 3% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil , or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/28/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 20  
 Investigator(s): L. Burris, A. Sennet, A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): flatland Local relief (concave, convex, none): concave Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.47326571 Long: -121.1727206 Datum: WGS84  
 Soil Map Unit Name: San Joaquin-Galt complex, 0 - 3% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

Remarks:

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/28/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 21  
 Investigator(s): A, Sennett, A. Godinho, L. Burris Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): Flatland Local relief (concave, convex, none): Concave Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.4730223 Long: -121.1728146 Datum: WGS84  
 Soil Map Unit Name: San Joaquin-Galt complex, 0 - 3% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil , or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/28/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 22  
 Investigator(s): A, Sennett, A. Godinho, L. Burris Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): Flatland Local relief (concave, convex, none): Convex Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.47303304 Long: -121.1729528 Datum: WGS84  
 Soil Map Unit Name: San Joaquin-Galt complex, 0 - 3% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil , or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

**Dominance Test worksheet:**  
 Number of Dominant Species That Are OBL, FACW, or FAC: 1 (A)  
 Total Number of Dominant Species Across All Strata: 2 (B)  
 Percent of Dominant Species That Are OBL, FACW, or FAC: 50 (A/B)

**Prevalence Index worksheet:**  
 Total % Cover of: \_\_\_\_\_ Multiply by: \_\_\_\_\_  
 OBL species 0 x 1 = 0  
 FACW species 0 x 2 = 0  
 FAC species 1 x 3 = 3  
 FACU species 1 x 4 = 4  
 UPL species 1 x 5 = 5  
 Column Totals: 3 (A) 12 (B)  
 Prevalence Index = B/A = 4

**Hydrophytic Vegetation Indicators:**  
 \_\_\_ Dominance Test is >50%  
 \_\_\_ Prevalence Index is ≤3.0<sup>1</sup>  
 \_\_\_ Morphological Adaptations<sup>1</sup> (Provide supporting data in Remarks or on a separate sheet)  
 \_\_\_ Problematic Hydrophytic Vegetation<sup>1</sup> (Explain)

<sup>1</sup>Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

**Hydrophytic Vegetation Present?** Yes \_\_\_\_\_ No

Remarks:  
 Thatch present

**SOIL**

Sampling Point: 22

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/28/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 23  
 Investigator(s): A, Sennett, A. Godinho, L. Burris Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): Flatland Local relief (concave, convex, none): Concave Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.47268315 Long: -121.1731092 Datum: WGS84  
 Soil Map Unit Name: San Joaquin-Galt complex, 0 - 3% slopes NWI classification: na

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil , or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/28/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 24  
 Investigator(s): L. Burris, A. Sennet, A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): flatland Local relief (concave, convex, none): concave Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.47304705 Long: -121.1740924 Datum: WGS84  
 Soil Map Unit Name: Galt clay, 2 - 5% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**

Remarks:

**WETLAND DETERMINATION DATA FORM – Arid West Region**

Project/Site: Sloughhouse Solar Energy Project City/County: Sacramento County Sampling Date: 10/28/2020  
 Applicant/Owner: D.E. Shaw Renewable Investments State: CA Sampling Point: 25  
 Investigator(s): L. Burris, A. Sennet, A. Godinho Section, Township, Range: Township 7N / Range 7E / Section 11  
 Landform (hillslope, terrace, etc.): flatland Local relief (concave, convex, none): concave Slope (%): 0  
 Subregion (LRR): \_\_\_\_\_ Lat: 38.4734797 Long: -121.1740923 Datum: WGS84  
 Soil Map Unit Name: Galt clay, 2 - 5% slopes NWI classification: n/a

Are climatic / hydrologic conditions on the site typical for this time of year? Yes  No \_\_\_\_\_ (If no, explain in Remarks.)  
 Are Vegetation , Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ significantly disturbed? Are "Normal Circumstances" present? Yes \_\_\_\_\_ No   
 Are Vegetation \_\_\_\_\_, Soil \_\_\_\_\_, or Hydrology \_\_\_\_\_ naturally problematic? (If needed, explain any answers in Remarks.)

**SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.**
