1.0 PURPOSE AND NEED

1.1 Overview

Municipal Energy Company (KPP Energy) was established in 2004 under Kansas statutes with the execution of an agreement creating KPP Energy by six Kansas municipalities: Augusta, Burlington, Marion, Neodesha, Wellington, and Winfield. Municipal energy agencies in Kansas are not-for-profit quasi-municipal organizations that are owned by their member municipalities. KPP Energy was organized as a pool to take collective action to preserve and invest in the members' energy facilities to satisfy, in the most efficient manner possible, the members' collective future energy and transmission requirements. To this end, the KPP Energy's operating philosophy is to equitably share resources and costs among all members through the computation of uniform annual wholesale electric rates approved by the members. To date, KPP Energy's membership includes 24 municipal electric utilities.

To supply the City of Marion, Kansas with reliable, clean, renewable energy, KPP Energy, in an agreement with the City of Marion, proposes to construct a solar energy generating facility with an estimated output of 1.0 megawatt – alternating current (“MW - AC”). The proposed solar facility would be located on an approximately 6.62-acre site (“Assessment Area”) owned by the City of Marion, and would consist of the construction of solar panels, powerlines, substations, transformer stations, roads, and other requisite infrastructure (“Project”).

KPP Energy has applied for federal funding under the Powering Affordable Clean Energy (“PACE”) program, which is a part of the Inflation Reduction Act (“IRA”) and administered by the U.S. Department of Agriculture (“USDA”) Rural Development (“RD”) Rural Utilities Service (“RUS”). PACE is designed to provide rural Americans with clean, affordable, and reliable energy (7 U.S. Code [USC] § 8103(h)). The PACE program is designed to provide financial assistance to eligible applicants that in turn would generate electricity for resale to America's rural and nonrural areas provided at least fifty (50) percent of the population served lives in communities with populations of 20,000 or fewer. Financial assistance through the PACE program includes direct/guaranteed loans to accomplish the program's objectives. Under PACE, up to sixty (60) percent of loans for renewable projects may be forgiven provided certain criteria are met.

KPP Energy prepared this Environmental Assessment (“EA”) to support RUS's National Environmental Policy Act (“NEPA”) review of the Project proposed for federal funding under the PACE program (40 Code of Federal Regulations (“CFR”) § 1500.4 (p) and 1508.4). RUS has been designated the lead agency for this EA. The purpose of the EA is to identify and assess potential direct, indirect, and cumulative effects of building and operating the Project. The EA was prepared in accordance with NEPA implementing regulations at 40 CFR 1500–1508 and RUS's NEPA guidance at 7 CFR Part 1970-Subpart C – *NEPA Environmental Assessments*. The purpose of the EA is to inform RUS of any significant effects to environmental and social resources in its review of the Project, and its decision to issue a Finding of No Significant Impact (“FONSI”) or require preparation of an Environmental Impact Statement (“EIS”).

This EA was prepared in accordance with 40 CFR Parts 1500-1508. In addition, this EA addresses, as applicable, other environmental laws, regulations, and executive orders promulgated to protect

and enhance environmental quality. Environmental laws, statutes, and regulations of relevance in preparation of this EA include:

- National Environmental Policy Act (42 USC § 4321)
- Endangered Species Act of 1973 (16 USC § 1531)
- Migratory Bird Treaty Act of 1918 (16 USC § 703-712)
- National Historic Preservation Act (16 USC. § 470)
- Clean Air Act of 1977 (43 USC § 7401)
- Clean Water Act of 1977 (33 USC. § 1251)
- Archaeological Resources Protection Act of 1979 (16 USC § 470)
- Native American Graves Protection and Repatriation Act of 1990 (25 USC § 3001–3013)
- Farmland Protection Policy Act (7 USC § 4201).

1.2 Project Description

KPP Energy is proposing to construct a 1.0 MW - AC solar energy generating facility on an approximately 6.62-acre tract located within the city limits of Marion in Marion County, Kansas. The Project would be located northwest of the intersection of West Washington Street and Vine (Street). The Project would be considered a small-scale community solar energy generating facility and would consist of the construction of ground-mounted photovoltaics (“PV”) mounted on a steel rack system, which would be anchored into the ground using driven steel piles. A total of 125 rows of PV panels would be installed with an approximately 21 feet spacing between rows. Interconnection cables would total approximately 50 feet and installed at a minimum depth of 18 inches. This project would utilize 8 inverters. In addition to the PV system, other infrastructure would include access roads, power conditioning systems, a switchyard facility, and other associated facilities. The solar generation facility has an expected 35-year lifespan. No battery storage will be associated with this development.

Access to the facility for construction and operations would be from West Washington Street. The areas where arrays would be installed (through driven piles) would be accessed by vehicles driving on the existing ground surface. During operations, vehicles would access the site from the access roads constructed at the onset of the Project – many of the panel arrays would be accessed by driving on existing ground. Minimal grading for access roads would be required.

The preexisting electrical distribution system is owned and operated by KPP Energy. The interconnection agreement, included in **Appendix C** as **Exhibit C-3**, states that “The nine solar projects do not necessitate an interconnection agreement between the city and KPP Energy. The energy generated by these arrays is categorized as “behind the meter” at each site and is not distributed onto the grid.” A general location map is included as **Exhibit A-1** in **Appendix A**. The preliminary site plan is included as an in-text exhibit (**Exhibit 1**) below.

Exhibit 1: Preliminary Site Plan and Location of Arrays

An on-site investigation of the Assessment Area was performed on January 31, 2024, to assess the environmental conditions on-site. Photographs recorded during the on-site assessment are included in **Appendix B** with a photograph location map included as **Exhibit B-1**.

Adjacent properties to the City owned parcel where the Proposed Action Alternative would be located include a Union Pacific owned railroad to the east, the Marion County Transfer Station and the VFW Hall and associated RV Park to the south, and row crop agriculture to the west and north. A former rail spur is also located to the north of the Assessment Area.

The Project would have a positive economic effect on the area and would assist KPP Energy in meeting the electricity demands of its customers. The Project would also help meet state and national goals to expand the use of renewable energy. Furthermore, the Project provides the opportunity to lessen consumer consumption of non-renewable energy and improve the environment by reducing effects of fossil fuel emissions.

1.3 Purpose and Need

USDA, Rural Development is a mission area that includes three federal agencies – Rural Business-Cooperative Service, Rural Housing Service, and Rural Utilities Service. The agencies have in excess of fifty (50) programs that provide financial assistance and a variety of technical and educational assistance to eligible rural and tribal populations, eligible communities, individuals, cooperatives, and other entities with a goal of improving the quality of life, sustainability, infrastructure, economic opportunity, development, and security in rural America. Financial assistance can include direct loans, guaranteed loans, and grants in order to accomplish program objectives.

KPP Energy is seeking financial assistance from USDA RD RUS under its PACE program, as authorized by the IRA.

The purpose of the Project is to construct an electric generating facility to provide 1.0 MW – AC of clean renewable energy to the residents in the Marion community. The City of Marion expressed interest in joining with KPP Energy for this Project to provide this service independently. KPP Energy is responding to a regional need for an affordable and reliable supply of electric power at competitive rates.

2.0 ALTERNATIVES EVALUATED INCLUDING THE PROPOSED ACTION AND NO ACTION

2.1 Introduction

NEPA requires that Federal agencies describe alternatives, including the “No Action” and “Proposed Action” alternatives, in their environmental documents (see Sections 102(2)(C)(iii) and 102(2)(E) of NEPA and 40 CFR § 1502.14). For proposals that are less complicated, single-site actions and in accordance with 7 CFR § 1970.13(a), Applicants are only required to consider and document the analysis of the “No Action” alternative if there are no potential adverse effects to environmental resources. For this review, the Project only needs to be evaluated with a “No Action” alternative as KPP Energy is proposing to complete a small-scale project at one (1) specific site and no adverse environmental effects are anticipated.

2.2 Proposed Action Alternative

Under the Proposed Action Alternative, RUS would consider providing financial assistance to KPP Energy through the PACE program to construct a 1.0 MW – AC solar energy generating facility on an approximately 6.62-acre tract located within the City of Marion, Marion County, Kansas. The Project would be located northwest of the intersection of West Washington Street and Vine (Street). The Project would be considered a small-scale community solar energy generating facility and would consist of the construction of ground-mounted PVs mounted on a steel rack system, which would be anchored into the ground using driven steel piles. A total of 125 rows of PV panels would be installed with an approximately 21 feet spacing between rows. Interconnection cables would total approximately 50 feet and would be installed at a minimum depth of 18 inches. This project would utilize 8 inverters. In addition to the PV system, other infrastructure would include access roads, power conditioning systems, a switchyard facility, and other associated facilities. No battery storage would be included in this proposed action.

The majority of the Assessment Area is an undeveloped, grass field with a wooded corridor along the northeastern and eastern boundaries of the site. At the time of the on-site investigation, the Assessment Area appeared to be used as a staging/storage yard due to observed dirt piles, debris, and construction equipment. The Project would involve limited vegetation clearing associated with minor grading of the site. The Project would be designed to avoid, minimize, or mitigate floodplains, streams, and wetland effects. During construction, requisite site controls (i.e., stormwater best management practices (“BMP”)) would be employed to minimize effects to downstream resources.

Construction of the solar facility would take approximately four to six months depending on availability of materials and would include minor grading of the surface to provide level surfaces

for equipment to safely operate around the requisite infrastructure. Road, parking, and staging surfaces would be a graveled road base while transformer pads would be cemented to allow maintenance crews unfettered access to these areas. The areas under each PV panel would remain uncovered to allow natural vegetation growth. The entire perimeter would be fenced, utilizing game fencing at a height of eight feet. Gates would be placed off main access roads that are able to open wide enough for equipment to easily pass through. Each gate would be secured with a chain and padlock.

Daily activities would be monitored remotely through a Network Operations Center. This eliminates frequent, sometimes daily, visits to the site. Monthly site inspections would occur to inspect the perimeter fence and facility components, such as vegetation heights, security areas, lighting, etc. Vegetation would be scheduled to be mechanically maintained quarterly unless vegetation is large enough to affect the operations of the solar facility. Overall maintenance would be conducted annually, unless an issue arises during the monthly inspections that requires immediate attention.

Upon decommissioning of the solar site, KPP Energy or their designated affiliate would remove all PV panels, steel piles, wiring, and associated facilities. The removed components that are still within operating parameters would be either reused or sold. Equipment beyond its useful life would be recycled to the extent practicable. Areas disturbed by the project would be returned to near pre-Project conditions. Soil in heavily trafficked (compacted) areas would be plowed or ripped to uncompact soils, allowing vegetation to reestablish naturally or seeded to provide immediate soil stabilization and vegetative cover. All non-recyclable, unusable materials, or general waste generated from the decommissioning of the facility would be hauled to an approved, licensed landfill for proper disposal in accordance with state and federal requirements/law.

2.3 Other Alternatives Evaluated and Not Carried Forward

The following actions were considered as part of the NEPA process; however, these actions have been eliminated from detailed study as part of this EA.

Marion is a member of KPP Energy and in a partnership with KPP Energy has agreed to develop a solar site on property owned and operated by the City. To minimize costs, the site selection criteria was limited to sites currently owned by the City of Marion. For the proposed Project to fulfill its purpose of supplying distributed power generation to the City of Marion, the proposed solar facility had to meet the following criteria:

- Undeveloped area in close proximity to Marion;
- Adjacent to an existing electrical distribution system suitable to support the additional load;
- Size, configuration, land use, and topography suitable to accommodate arrays to produce 1.0 MW-AC;
- No structures to be demolished;
- Not in a floodplain;
- Not in wetlands;
- No effects to surface waters;
- Compatibility with local ordinances and development permits; and

-
- Reasonable constructability and development costs.

Based on the site selection criteria, the proposed site was the only suitable location available to support the proposed solar facility. Accordingly, alternative sites were not evaluated.

Other means of electricity generation were considered; however, it was determined the only viable means of power generation would be from the construction and operation of a solar array.

Wind – KPP Energy did not consider the option of wind strictly due to the size of the footprint required. The average number of acres of land per MW of power generation by wind is 85 (Rosenbloom, 2006). The proposed site is 6.62 acres, which is insufficient to generate the targeted 1.0 MW – AC.

Geothermal - Electricity from geothermal energy sources is not widely utilized in Kansas. All large-scale geothermal electrical power plants in the United States are located west of the Rockies – east of the Rockies, water-bearing geology hot enough to generate electricity is too deep to be easily accessed (Kansas Geological Survey, 2011). Accordingly, Kansas has no direct-use systems and limited near-surface geothermal resources to implement large-scale geothermal electrical power plants. However, several commercial and residential sites in the state use geothermal heat pumps to heat and cool buildings (Kansas Geological Survey, 2011). This alternative was not considered due to the larger scale energy need that likely would not be met using geothermal sources.

2.4 No Action Alternative

Under the No Action Alternative, RUS would not provide PACE financial assistance to KPP Energy, and the Project would likely not be constructed. The No Action Alternative would leave the 6.62-acre tract undisturbed and in its current condition. KPP Energy would maintain their reliance on other sources for power generation (i.e., coal or natural gas power generation facilities) to meet the power demands for Marion. The No Action Alternative does not achieve the purpose of and need for the Project.

2.5 Environmental Resources Not Carried Forward for Detailed Analysis

The determination of environmental resources to be analyzed versus those not carried forward for detailed analysis is part of the EA scoping process. Council on Environmental Quality (CEQ) regulations (40 CFR §1501.7[a] [3]) encourage project proponents to identify and eliminate from detailed study the resource areas that are not important or have no potential to be affected through implementation of their respective proposed actions. Some resource areas or some aspects of resource areas would not be affected by the proposed or alternative actions. Resource areas that have been eliminated from further study in this document and the rationale for eliminating them are presented below:

Coastal Resources – The Assessment Area is not located within a state identified in the Coastal Zone Management Act of 1972 or Coastal Barriers Resources Act; therefore, there are no effects to coastal resources. No further analysis is required.

Surface Waters – Surface waters are considered open waters, impoundments, lakes, ponds, or similar (EPA’s Environmental Monitoring and Assessment Program, 2016). The Assessment Area is not located on or adjacent to identified surface waters; therefore, there are no effects to surface waters. No further analysis is required.

Corridor Analysis – A corridor analysis is not applicable for this Project Area as it does not follow a linear path nor have large electrical transmission lines, telecommunication cables, water or wastewater pipelines leading to or away from it; therefore, a detailed analysis is not required.

3.0 AFFECTED ENVIRONMENT AND ENVIRONMENTAL CONSEQUENCES

This chapter describes the current conditions of the environmental resources, either manmade or natural, that would be affected by implementation of the Proposed Action or alternatives. This chapter also describes the potential environmental effects that are likely to occur because of the implementation of the Proposed Action. The No Action Alternative provides a baseline against which the effects of the Proposed Action can be compared. Several key factors were taken into consideration when analyzing each environmental resource for environmental consequences:

- Timing of the effects to the resource. Quantifiable inputs and outputs can be described as temporary, defined as lasting for only a limited period of time, or permanent, defined as intending to last through the life of the project or beyond.
- Degree of effect to environmental resources. Each effect can be characterized as negligible, minor, moderate, or major to each environmental resource. Negligible effects are those that are so small or imperceivable that their effects cannot be accurately observed or measured, and are therefore of so little consequence that the environmental resource is not expected to be altered. Minor effects are those that are slight and may have little effect to the environmental resource. Moderate effects are those that are higher in intensity and may have additional effects to the environmental resource. Major effects are those that have a significant change to the environmental resource and may produce a different outcome.

3.1 Land Use

This section describes an overview of the existing land use at and surrounding the Assessment Area and the potential effects to those resources associated with the Project.

3.1.1 General Land Use and Ownership

Land use refers to the use of land for various activities, including commercial, industrial, recreational, agricultural, and residential. Adopted plans and development regulations control the type of land use and the intensity of development or activities permitted. Changes in land use patterns that result from development can affect the character of an area and result in physical effects to the environment. Many municipalities develop zoning ordinances and planning documents to control the direction of development and to keep similar land uses together. This section describes the land use and ownership resources occurring in the Project Area and the potential effects to those resources due to project implementation.

3.1.1.1 Affected Environment

The 6.62-acre Project is owned by the City of Marion. The Assessment Area is in Section 31, Township 19S, Range 4E (6th P.M., Book 367, Page 433). The Assessment Area consists of an undeveloped, grass field with a wooded corridor along the northeastern and eastern boundaries of the site. At the time of the on-site investigation, the Assessment Area appeared to be used as a staging/storage yard due to observed dirt piles, debris, and construction equipment. Based on historic aerial imagery, the Assessment Area has been utilized for commercial agricultural production; however, is currently being utilized as a storage yard for the City of Marion. Currently the parcel of land the Assessment Area resides in is exempt and is not zoned. Adjacent land uses include residential to the east, agricultural to the north and west and Marion County construction and storage yard to the south.

3.1.1.2 Environmental Consequences

Proposed Action Alternative:

Under the Proposed Action Alternative, the entire 6.62-acre site would be converted, changing the land use from agricultural cropland to a renewable energy facility. The ownership of the property would not change. No zoning would occur as the City has approved a utility easement under the current conditions. No changes to adjacent land uses would occur.

No Action Alternative:

Under the No Action Alternative, the undeveloped, grass field would remain as is resulting in no change to land uses.

3.1.1.3 Mitigation

No mitigation measures are proposed as the land use conversion from an undeveloped grass field to renewable energy would result in no significant adverse effects. KPP Energy worked closely with the City to avoid encroachments to adjacent infrastructure.

3.1.2 Important Farmlands

The Farmland Protection Policy Act of 1981 (“FPPA”) was established to minimize the extent of unnecessary and irreversible conversion of farmland to nonagricultural uses contributed by Federal programs. The regulation’s goal is to reduce the rate and amount of adaptation of the nation’s farmlands, forest lands, and rangelands, which impairs the ability to produce sufficient domestic agricultural needs. The FPPA definition of farmland includes all land defined as follows:

- a) Prime farmland is land that has the best combination of physical and chemical characteristics for producing food, feed, fiber, forage, oilseed, and other agricultural crops with minimum inputs of fuel, fertilizer, pesticides, and labor, and without intolerable soil erosion, as determined by the Secretary. Prime farmland includes land that possesses the

above characteristics but is being used currently to produce livestock and timber. It does not include land already in or committed to urban development or water storage.

- b) Unique farmland is land other than prime farmland that is used for production of specific high-value food and fiber crops, as determined by the Secretary. It has the special combination of soil quality, location, growing season, and moisture supply needed to economically produce sustained high quality or high yields of specific crops when treated and managed according to acceptable farming methods. Examples of such crops include citrus, tree nuts, olives, cranberries, fruits, and vegetables; and
- c) Farmland, other than prime or unique farmland, that is of statewide or local importance to produce food feed, fiber, forage, or oilseed crops, as determined by the appropriate State or unit of local government agency or agencies, and that the Secretary determines should be considered as farmland for the purposes of this subtitle.

3.1.2.1 Affected Environment

The Natural Resource Conservation Service (“NRCS”) Web Soil Survey program was accessed to obtain a Custom Soil Resource Report for the Assessment Area. According to the report, the mapped soil units within the Assessment Area is classified as Prime Farmland (**Table 1**). See the mapped soil units included as **Exhibit A-7** in **Appendix A**.

Table 1: Farmland Classification

Map Unit Name	Map Unit Symbol	Percent of Assessment Area	Farmland Classification
Chase silty clay loam, occasionally flooded	4020	87.2	Prime Farmland
Verdigris silt loam, 0 to 1 percent slopes, occasionally flooded	8302	12.8	Prime Farmland

3.1.2.2 Environmental Consequences

Proposed Action Alternative:

The primary impact from the development of the Proposed Action Alternative would be the conversion of an undeveloped grass field into solar generation facility. This process would result in temporary disturbance to the soil during construction activities. However, according to RD Instruction 1970-L § 1970.557 (b), the Assessment Area “qualifies as an exemption under the FPPA” due to the Assessment Area being located within “incorporated city limits” for the City of Marion. Therefore, coordination with the NRCS is not required to obtain a Land Evaluation and Site Assessment (“LESA”) score.

No Action Alternative:

Under the No Action Alternative, the undeveloped grass field would remain in production resulting in no change to important farmlands.

3.1.2.3 Mitigation

No mitigation measures are proposed since the resource is exempt from LESA review.

3.1.3 Formally Classified Lands

Formally Classified Lands are properties that are administered either by Federal, State, or local agencies, or have been given special protection through formal legislative designation (USDA Rural Development, 2008). Formally Classified Lands include National Parks, National Forests/Grasslands, Monuments, Historic Landmarks, Battlefields, Military Parks, Heritage Areas, Historic Sites, Historical Parks, Natural Landmarks, Wildlife Refuges, Seashores, Lake Shores, Trails, Wilderness Area, State Parks, State Fish and Wildlife Management Areas, Bureau of Land Management administered lands, Native American owned lands and leases, or Wild, Scenic and Recreational Rivers, all of which are managed by several Agencies. Other Formally Classified Lands are discussed in other sections of this EA including Coastal Resources, Biological Resources, and Cultural Resources and Historic Properties.

3.1.3.1 Affected Environment

The United States Geological Survey (“USGS”) Protected Areas Database of the United States (“PADUS”) online mapping system (A Resource for the Protected Areas Database of the United States (PAD-US), 2024) was accessed to determine if the Assessment Area is within any NRCS easements (i.e., crop reserve program or wetland reserve program), or other Federal, State, County, or Tribal owned or managed property would be affected by the Project. The Assessment Area is not located within Formally Classified Lands according to the USGS PADUS online mapping system. A USGS PADUS Map is included in **Appendix C** as **Exhibit C-2**. However, a review of the County Assessor’s (Marion County Appraisal District, 2024) records identified that the Assessment Area is currently owned by the City of Marion and should be considered a Formally Classified Land. See the City of Marion Electric Generation Utility Easement in **Appendix C** as **Exhibit C-4**.

3.1.3.2 Environmental Consequences

Proposed Action Alternative:

As the Project is in direct response to the local municipality entering into an agreement with KPP Energy for participation in the power pool, this Project is sanctioned by the City and has been approved by the respective city councils, managers, and community. The land would still be owned by the City of Marion. The City has conveyed an easement to KPP Energy to place the solar array on City property.

No Action Alternative:

Under the No Action Alternative, the undeveloped grass field would remain, resulting in no change to Formally Classified Lands.

3.1.3.3 Mitigation

No mitigation measures are proposed as the land would still be owned by the City of Marion resulting in no change to Formally Classified Lands.

3.2 Floodplains

This section describes an overview of the existing floodplain resources in proximity to the Assessment Area and the potential effects to those resources that would be associated with implementation of the Project.

A floodplain is any land area susceptible to being inundated by floodwaters from any source. Floodplains are essential to clean water, recharge of water supplies, reduction of flood risks and protection of property, human safety, health and welfare and fish and wildlife habitat (FEMA Flood Zones, 2020). Proper floodplain management would reduce flood losses and ensure the protection of the natural resources and functions of floodplains. The relevant floodplain area to be evaluated is an area that has either a one-percent probability of flood occurrence in a given year (100-year flood) or a 0.2-percent probability of flooding in a given year (500-year flood).

Executive Order (“EO”) 10584 for the protection of floodplains and floodplain development and EO 11988, *Floodplain Management*, requires federal agencies to avoid actions, to the extent possible, where there are long and short-term adverse effects associated with the occupancy or modification of floodplains and to avoid direct and indirect support of floodplain development wherever there is a practical alternative. Facilities located in a floodplain may be damaged or destroyed by a flood or may change the flood-handling capability of the natural floodplain or the pattern or magnitude of flood flows.

3.2.1 Affected Environment

The City of Marion is located along the Cottonwood River downstream from Marion Reservoir, a lake constructed and operated by the U.S. Army Corps of Engineers on the Cottonwood River approximately three miles northwest of the City of Marion. The purpose of the Marion Reservoir is for flood control. In addition to the flood control reservoir, the City of Marion is flood protected by the Cottonwood River Levee, see in text **Exhibit 2**. The Cottonwood River Levee is an earth-filled embankment levee approximately three miles in length and situated along the western limits of the City. It has an average height of 15 feet, and a crest width of 10 feet. This levee system is considered “low risk” for failure due to the ongoing operations and maintenance activities by the City of Marion (USACE, 2024). The Assessment Area is located behind this flood protection levee system.

Exhibit 2: Cottonwood River Levee System in Marion, Marion County, Kansas (obtained from GoogleMaps, 2024)

According to the Federal Emergency Management Agency's ("FEMA") Flood Insurance Rate map ("FIRM") (Community Panel 20115C0307E effective date: 07/17/2024), the Assessment Area is in a FEMA designated Zone X, Area with Reduced Flood Risk due to the Cottonwood River Levee also known as the Marion Levee (FEMA's National Flood Hazard Layer Viewer, 2024). Per FEMA's definition, Zone X is the area determined to be outside the 500-year flood and protected by levee from 100- year flood. The entire area within and surrounding the City of Marion has had detailed floodplain studies performed by the USACE. These studies, as shown on Community Panel 20115C0307E, illustrate the Flood Hazard Areas for each floodplain classification. The detailed floodplain model calculated the Assessment Area to be in the FEMA designated reduced risk Zone X, Area with Reduced Flood Risk Due to a Levee – See **Exhibit A-6** in **Appendix A**.

3.2.2 Environmental Consequences

Proposed Action Alternative:

Under the Proposed Action Alternative, the Assessment Area would be located within a FEMA designated floodplain – Zone X, Area with Reduced Flood Risk due to the Cottonwood River Levee. The Cottonwood River Levee system was constructed by May 1980. This levee system protects approximately 655 people who live and work behind this levee system. Without the levee in place, it is estimated that approximately 575 residential and commercial structures could be flooded (USACE, 2024) There would be no increases to the 100-year or 500-year flood elevation or present barriers to floodway passage within the Assessment Area because the levee system is in place and is routinely maintained by the City of Marion, the likelihood of the Project being flooded is low..

No Action Alternative:

Under the No Action Alternative, the Assessment Area would remain in its current condition and the area would continue to be in Zone X, Area with Reduced Flood Risk due to the Cottonwood River Levee.

3.2.3 Mitigation

The City of Marion requires building permits prior to construction. One of the review mandates is to determine if the proposed development is located within a floodplain overlay for the City. The City of Marion, who is also the floodplain administrator, would review the Proposed Action Alternative, and determine mitigative actions needed to alleviate any modifications (rise) to the floodplain, if required.

3.3 Wetlands

This section describes an overview of the existing wetland resources within the Assessment Area and the potential effects to those resources that could result with the implementation of the Project.

Wetlands are considered as areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions (USACE and USEPA Wetland Definition, 2024). The U.S. Army Corps of Engineers (“USACE”) uses three characteristics when making wetland determinations: vegetation, soil, and hydrology. Unless an area has been altered or is a rare natural situation, wetland indicators of all three characteristics must be present during some portion of the growing season for an area to be considered a wetland.

EO 11990, *Protection of Wetlands*, states that it is federal policy to avoid, to the extent possible, the long and short-term adverse effects associated with the destruction or modification of wetlands and to avoid direct or indirect support of new construction in wetlands, wherever practical. Additionally, federal agencies are required to take actions to minimize the destruction, loss, or degradation of wetlands and to preserve and enhance the natural and beneficial values of wetlands. Regulatory oversight of wetlands falls under Section 404 of the Clean Water Act (“CWA”) and permits are administered by the USACE with oversight by the U.S. Environmental Protection Agency (“USEPA”).

Section 404 of the CWA regulates the discharge of dredge and fill materials into Waters of the United States (“WOTUS”). WOTUS include territorial seas, navigable coastal and inland lakes, river and streams, intermittent streams, and wetlands. Section 401 of the CWA grants each state the authority to approve, deny, or condition any Federal permits that could result in a discharge to State waters (also known as the Water Quality Certification). Jurisdictional features (features subject to Section 404 of the CWA) may include but are not limited to wetlands, open waters, ponds, lakes, and perennial/intermittent streams. Permits may be required prior to effecting

jurisdictional features depending on the type, location, and degree/amount of effect. (USEPA Section 404 of the Clean Water Act, 2024).

3.3.1 Affected Environment

The U.S. Fish and Wildlife Service’s (“USFWS”) National Wetland Inventory (“NWI”) Map (USFWS Download Seamless Wetlands Data by State, 2024) and the U.S. Geological Survey’s (“USGS”) National Hydrography Database (“NHD”) (USGS National Map Downloader, 2024) were reviewed for the Assessment Area. Based on the review, there are no NWI nor NHD features within the Assessment Area (**Exhibits A-4 and A-5 in Attachment A** show the proximity of NWI and NHD features relative to the Assessment Area, respectively.). Further, the National Hydric Soils Rating database was reviewed for the mapped soils within the Assessment Area. Both soil types mapped within the Assessment Area are considered “hydric” (NRCS Hydric Soils List, 2024). On January 31, 2024, Topographic scientists conducted a wetland and stream delineation of the 6.62-acre Assessment Area in support of the Project. Four (4) wetland-determination data forms were recorded in the Assessment Area to determine the presence/absence of wetland resources – negative results were recorded by three of the four sampling locations (See **Exhibit E-2 in Appendix E**). After conducting an on-site investigation, one (1) palustrine forested wetland was identified. This forested wetland is located along a now defunct railroad embankment within a drainage ditch that parallels the railroad right of way – located in the northeast corner of the Assessment Area. This wetland feature would not likely be affected due to anticipated avoidance during the construction phase.

3.3.2 Environmental Consequences

Proposed Action Alternative:

Under the Proposed Action Alternative, the delineated wetland would be avoided, resulting in no effects.

No Action Alternative:

Under the No Action Alternative, the delineated wetland will remain unchanged, resulting in no effects to the wetland.

3.3.3 Mitigation

Barrier fencing likely in the form of silt fencing or similar would be placed along the perimeter of the wetland feature during construction to avoid intrusion into the forested wetland from construction related activities. Further, appropriate erosion and sediment control best management practices would be employed during construction to minimize mobilized soils or sediment from moving offsite potentially impacting downgradient aquatic resources to include wetlands.

3.4 Water Resources

This section provides an overview of water resources near the Assessment Area and addresses water quantity and quality issues related to discharges to or appropriations from surface or groundwater, groundwater protection programs (e.g., sole source aquifers and recharge areas) and water quality degradation from temporary construction activities. Water quality and quantity changes can affect other environmental resources including but not limited to groundwater and drinking water supplies, threatened and endangered species, other fish and wildlife species, and wetlands. Effects to surface and/or groundwater would be KPP Energy's responsibility and permitting requirements, typically through state agencies, would be adhered to.

3.4.1 *Affected Environment*

Safe Water Drinking Act

The Kansas Department of Health and Environment ("KDHE") Public Water Supply Section is charged with regulation of all public water supply systems in the state to ensure safe drinking water as defined by Kansas Statutes Annotated 65-162a and Kansas Administrative Regulations 28-15a-2. The Project would adhere to all State regulations and local ordinances regarding drinking water quality. Wellhead Protection Areas ("WHPA") were also reviewed to determine if the Assessment Area is located in or drains into a sensitive well or wellfield supplying a public water system as defined by the Safe Drinking Water Act ("SDWA"). Topographic submitted a Kansas Open Records Act ("KORA") request to obtain this information and specify WHPA locations in Kansas as it relates to the Assessment Area. Communication, via e-mail, with Kansas Department of Health and Environment ("KDHE") representatives provided a map of the WHPAs within the state and has returned positive results for the Assessment Area. The WHPA location map is included in **Appendix G** as **Exhibit G-3** and KDHE chain of communication as **Exhibit G-4**.

Stormwater

The KDHE Wastewater & Stormwater Permitting and Compliance Section regulates construction stormwater, wastewater, and waste disposal. Based on the size of the proposed development, KDHE would require authorization under the Construction Stormwater General Permit. Excavation dewatering requires authorization under a general permit unless comprised entirely of stormwater. KDHE requires notification if encountering contamination or in areas of known contamination when excavating.

Ground Water

The KDHE Water Well Program is charged with providing for the exploration and protection of groundwater. Sole Source Aquifers ("SSAs") are important sources of fresh water in certain portions of the United States. A review of the EPA's Interactive Map of Sole Source Aquifers ("SSA") (EPA Interactive Map of Sole Source Aquifers, 2024) was performed to determine if any streamflow zones, aquifer recharge areas, or other features at the land surface important for SSA designations are to be within the Assessment Area. The review of SSAs returned negative results for the state of Kansas.

Surface Water

The Kansas Total Maximum Daily Load ("TMDL")/303d Viewer identifies the impaired waters and TMDLs on Kansas waterways. It is required by the Clean Water Act for states to prepare a list

of surface waters and the impairments of Kansas waterways every even numbered year. The Kansas TMDL/303d Viewer identified the nearest water to the Project as Cottonwood River (110702027). Cottonwood River is located approximately 0.29 miles west from the nearest point of the Project and is not identified as an impaired water under 303(d) requirements for Kansas' TMDLs.

3.4.2 Environmental Consequences

Proposed Action Alternative

Under the Proposed Action Alternative, effects to water resources would be minimal. Short-term, minor water quality effects may occur during the construction of the Project. These effects would be associated with soils from disturbed areas being mobilized by storm water into adjacent areas during rainstorm events; however, these effects would be temporary and would not significantly alter water quality conditions or effect any WHPA.

There would be no anticipated effects to groundwater aquifers associated with the Project. Wastewater would not be generated, and process water would not be required for construction or operation of the Project. The Project would not add any impervious surfaces to the Assessment Area and vegetation would be maintained wherever possible throughout the operational life of the facility to reduce the potential for erosion and shading.

No Action Alternative:

Under the No Action Alternative, an undeveloped grass field would remain the primary land use within the Assessment Area, resulting in no change to effects of water resources.

3.4.3 Mitigation

Due to the size of the project, a Stormwater Pollution Prevention Plan ("SWPPP") would be required. Additionally, BMPs such as soil erosion and sediment control measures would be utilized during construction to minimize the potential for increased runoff and siltation. WHPAs should not be affected from the implementation of the Project.

3.5 Biological Resources

This section describes an overview of the existing biological resources within the Assessment Area and the potential effects to those resources that would be associated with the Project. Biological resources refer to the flora (plants) and fauna (invertebrates, fish, birds, amphibians, reptiles, birds, and mammals) that may be found or have historically been found at the Assessment Area. Biological resources may also include rivers, lakes, wetlands, upland communities, and other habitat types necessary to support local flora and fauna. Vegetation is a key habitat component and acts to stabilize soils and prevent erosion; additionally, information on vegetation can be used in evaluating potential effects to species and habitats. Potential effects to biological resources can be direct (project-related mortality) or indirect (displacement, degradation, or loss of habitat). Effects

of the Proposed Action on Federally listed species, as well as other species of concern, and critical habitat must be addressed.

3.5.1 General Biological Resources

3.5.1.1 Affected Environment

The Assessment Area lies within Kansas' Flint Hills Level III Ecoregion and the Flint Hills Level IV Ecoregion. The Flint Hills ecoregion is the largest remaining intact tallgrass prairie in the Great Plains. This region is characterized by rolling hills composed of shale and cherty limestone, rocky soils, and by humid, wet summers. The Flint Hills region marks the western edge of the tallgrass prairie. The natural tallgrass prairie still exists in most areas and is used for range and pastureland. However, some cropland agriculture has been implemented in river valleys and along the periphery of the Flint Hills, especially in the northwest corner where the topography is more level. Average annual precipitation ranges from 28 to 35 inches. (Chapman, Shannen S. et. al., 2001).

Common fauna known to be in the area could include but not limited to, White-tailed Deer (*Odocoileus virginianus*), Raccoon (*Procyon lotor*), Fox Squirrel (*Sciurus niger*), Coyote (*Canis latrans*), assorted passerine birds, hawks, vultures, bees, moths and reptiles. Fauna within the Assessment Area includes species common to the mixed and tall grass prairies. The area is generally disturbed with early successional plants dominating the Assessment Area interspersed with bunch grasses like Little Bluestem (*Schizachyrium scoparium*).

3.5.1.2 Environmental Consequences

Proposed Action Alternative:

Under the Proposed Action Alternative, there would be no effects to the general ecoregions. As the Assessment Area is currently utilized as a storage/staging facility for the City, the only use available to local species and individuals would be space. Effects to terrestrial wildlife would include potential disruption in travel across the landscape. However, the Assessment Area is very small and would not significantly impede terrestrial animal's movement through the extensively urbanized landscape. Native flora will be allowed to reestablish providing increased habitat for several native species of flowering plants that would aid local pollinators including the Monarch Butterfly.

No Action Alternative:

Under the No Action Alternative, there would be no effects to the general ecoregions, flora or fauna.

3.5.1.3 Mitigation

No mitigation measures are proposed as there are no anticipated effects to general biological resources.

3.5.2 Listed Threatened and Endangered Species

The Endangered Species Act (“ESA”) is enforced by the USFWS and provides the protection and recovery of species threatened with extinction and ensures federal agencies use their authorities to further the purpose of the ESA to protect and conserve endangered and threatened species. The ESA defines a federally endangered species as any species which is in danger of extinction throughout all or a significant portion of its range (USFWS ESA Endangered Species, 2024). The ESA also identifies habitats critical to listed species and potential mitigation strategies within these habitats. Section 7 of the ESA requires that all federal agencies consult with the USFWS regarding potential effects that their federal actions could have to listed species (USFWS ESA Section 7 Consultation, 2024).

3.5.2.1 Affected Environment

An official species list obtained from the USFWS Information for Planning and Consultation (“IPaC”) System (August 27, 2024) identified five (5) federally listed, proposed listed, and candidate species (**Table 2**) in Marion County with potential to occur within the Assessment Area. See USFWS IPaC Official Species List in **Appendix G** as **Exhibit G-1**.

Table 2: USFWS IPaC List of Threatened, Endangered, or Candidate Species Marion County, Kansas

Species	Status	Environmental Baseline for Potential Habitat	Potential Habitat Presence/Species Potential for Occurrence within the Assessment Area	Species Analysis Required	Determination of Effect
Neosho Madtom (<i>Noturus placidus</i>)	Threatened (Federal)	The Neosho Madtom inhabits permanent flow of medium-sized to moderately large, medium-gradient streams, moderate to strong currents; usually in fairly clear water under rocks in riffles with small, loosely packed gravel-pebble; sometimes in pools adjacent to riffles or near tree trunks in slack water downstream from riffles; nonriffle occurrences may be most frequent during periods of low flow when riffles are not inundated.	No habitat exists for this species within the Assessment Area; therefore, potential for occurrence is unlikely.	No further analysis would be required for determination of effect.	"No Effect"
Topeka Shiner (<i>Notropis topeka</i>)	Endangered (Federal)	The Topeka Shiner typically inhabits quiet, open, permanent pools of small, clear, high-quality headwaters and creeks that drain upland prairie areas, including tiny spring-fed pools in headwater streams and larger streams.	No habitat exists for this species within the Assessment Area; therefore, potential for occurrence is unlikely.	No further analysis would be required for determination of effect.	"No Effect"
Monarch Butterfly (<i>Danaus plexippus</i>)	Candidate (Federal)	Monarch Butterfly habitat is a complex issue for this species. In general, breeding areas are virtually all patches of milkweed in North America and some other regions. The critical conservation feature for North American populations is the overwintering habitats, which are certain high altitude Mexican conifer forests or coastal California conifer, or Eucalyptus groves as identified in literature.	No preferred habitat exists within the Assessment Area due to frequent mechanical and/or chemical maintenance for unwanted vegetation such as weeds. Therefore, potential for occurrence is unlikely.	No further analysis would be required for determination of effect.	"No Effect"

3.5.2.2 Environmental Consequences

Proposed Action Alternative:

Under the Proposed Action Alternative, listed threatened or endangered species would not be affected by the Project based on the lack of suitable habitat and protected species' requirements. No designated critical habitat (defined as specific areas within the geographic area, occupied by the species at the time it was listed, that contain the physical or biological features that are essential to the conservation of endangered and threatened species and that may need special management or protection (USFWS Critical Habitat, What Is It?, 2024)) for federally listed species occurs within the Assessment Area nor would any be affected by the Project. When listed species or critical habitat are not known to occur or potentially occur in the Assessment Area, or if there is no mechanism to affect the listed species or critical habitat, as is the case for the Project, a “**No Effect**” determination can be reached and consultation with the USFWS is not required under the ESA. To date, one species is not formally listed (currently listed as candidate) and consequently received a determination of “**No Impact**”. See attached USFWS IPaC in **Appendix G** as **G-1**.

Proposed No Action Alternative:

Under the No Action Alternative, an undeveloped grass field would remain the primary land use within the Assessment Area. No change in land use would result in a “**No Effect**” to all listed species and a “**No Impact**” to all candidate and/or proposed species.

3.5.2.3 Mitigation

The construction and operation of the Project would comply with the ESA, which provides for the protection of endangered and/or threatened species and critical habitat. Should any evidence of the presence of endangered and/or threatened species or their critical habitat occur, the findings would be brought to the attention of the contractor and the contractor would immediately report this evidence to KPP Energy. Construction would be temporarily halted pending the notification process and further directions issued by the USFWS following the consultation.

3.5.3 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (“MBTA”) is enforced by the USFWS and makes it illegal for anyone to take, possess, import, export, transport, sell, purchase, barter, or offer for sale, purchase, or barter any migratory bird or the parts, nests, eggs of such bird except under the terms of a valid permit issued (USFWS Migratory Birds, 2000).

3.5.3.1 Affected Environment

The USFWS IPaC Report obtained for the Assessment Area lists no migratory bird species that are of conservation concern or may be potentially affected by activities within the Assessment Area. Alternatively, the North American Bird Conservation Initiative (“NABCI”) Birds of Conservation Concern Migratory Bird Program was reviewed to determine the Bird Conservation Region (“BCR”) for the Assessment Area and identify migratory bird species that may be affected

by the proposed action alternative. The Assessment Area is located within BCR 22 Eastern Tallgrass Prairie. Beech-maple Forest dominate the eastern sections, and the prairie and woodland ecotone between the two was marked by broad and dynamic oak-dominated savanna (NABCI Bird Conservation Regions, 2024). It is important to note that this list is not exclusive to species protected under the MBTA; however, serves as a targeted list of species of conservation concern in response to the absence of a species list provided by IPaC. **Table 3** includes the listed migratory birds, habitat descriptions, and effect determinations.

Table 3: NABCI Migratory Birds of Conservation Concern Summary BCR 22 Eastern Tallgrass Prairie

Species	Status	Environmental Baseline for Potential Habitat	Potential Habitat Presence/Species Potential for Occurrence within the Assessment Area	Species Analysis Required	Determination of Effect
Black-billed Cuckoo (<i>Coccyzus erythrophthalmus</i>)	Concern	The breeding habitat of the Black-billed Cuckoo contains forest edge and open woodland, both deciduous and coniferous, with dense deciduous thickets. This species nests in groves of trees, forest edges, moist thickets, overgrown pastures, and in deciduous or evergreen trees or shrubs about 1.8 meters above ground. At times, the Black-billed Cuckoo nests almost on the ground and is concealed by tall herbage.	Preferred nesting habitat may exist for this species within the Assessment Area due to its generalist nature, therefore, potential for occurrence is likely.	No further analysis would be required for determination of effect.	“May Impact”
Eastern Whip-poor-will (<i>Antrostomus vociferus</i>)	Concern	The breeding habitat of the Eastern Whip-poor-will is open woodlands with well-spaced trees and a low canopy. Uncommon in mature forest; prefers even-aged successional habitats from regeneration to pole-stage stands. Rests on ground or on branch, in thicket at forest edge, in hedgerow or gallery forest. Lays eggs on ground in open site under trees or under bush, usually on a bed of dead leaves at woods edge or in open woodland.	No preferred nesting habitat exists for this species within the Assessment Area due to the lack of open woodland habitat, therefore, potential for occurrence is unlikely.	No further analysis would be required for determination of effect.	“No Impact”
Chimney Swift (<i>Chaetura pelagica</i>)	Concern	The breeding range of the Chimney Swift is from south to eastern New Mexico, southern Texas, Gulf Coast, and southern Florida, and west to southeastern Wyoming and eastern Colorado. This species inhabits rural and urban environments having both an abundance of flying arthropods and suitable roosting/nesting sites. Nests are principally in chimneys, but also on the interior walls of a variety of other anthropogenic structures including silos, barns, outhouses, uninhabited houses, boathouses, wells, and cisterns.	No preferred nesting habitat exists for this species within the Assessment Area due to the lack of suitable anthropogenic structures and adequate woody vegetation therefore, potential for occurrence is unlikely.	No further analysis would be required for determination of effect.	“No Impact”

Species	Status	Environmental Baseline for Potential Habitat	Potential Habitat Presence/Species Potential for Occurrence within the Assessment Area	Species Analysis Required	Determination of Effect
Upland Sandpiper (<i>Bartramia longicauda</i>)	Concern	The breeding habitat of the Upland Sandpiper is restricted primarily to extensive, open tracts of short grassland habitat. Nest in native prairie, dry meadows, pastures, domestic hayfields, short-grass savanna, plowed fields, along highway rights-of-way and on airfields, and (in the north) peatlands and scattered woodlands near timberline.	No preferred nesting habitat exists for this species within the Assessment Area due to the lack of extensive short grassland habitat, therefore, potential for occurrence is unlikely.	No further analysis would be required for determination of effect.	"No Impact"
Red-headed Woodpecker (<i>Melanerpes erythrocephalus</i>)	Concern	Red-headed Woodpeckers typically nest in a hole excavated 2-25 meters above the ground in a live tree, dead stub, utility pole, or fencepost. Individuals typically nest in the same tree or cavity in successive years and summer territories extended from 3.1-8.5 hectares.	Preferred nesting habitat may exist for this species within the Assessment Area due to the presence of suitable nesting trees, therefore, potential for occurrence is unlikely.	No further analysis would be required for determination of effect.	"May Impact"
Loggerhead Shrike (Eastern) (<i>Lanius ludovicianus</i>)	Concern	The breeding habitat of the Loggerhead Shrike consists of open country with scattered trees and shrubs, savanna, desert scrub (southwestern U.S.), and, occasionally, open woodland; often perches on poles, wires or fenceposts (Tropical to Temperate zones). Suitable hunting perches are an important part of the habitat.	Preferred nesting habitat may exist for this species within the Assessment Area, therefore, potential for occurrence is unlikely.	No further analysis would be required for determination of effect.	"May Impact"
Wood Thrush (<i>Hylocichla mustelina</i>)	Concern	The breeding habitat of the Wood Thrush consists of deciduous or mixed forests with a dense tree canopy and a fairly well-developed deciduous understory, especially where moist. Bottomlands and other rich hardwood forests are prime habitats. Thickets and early successional woodland generally do not provide suitable habitat.	No preferred nesting habitat exists for this species within the Assessment Area due to the lack of mature forest therefore, potential for occurrence is unlikely.	No further analysis would be required for determination of effect.	"No Impact"
Grasshopper Sparrow (<i>Ammodramus savannarum</i>)	Concern	The breeding habitat of the Grasshopper Sparrow consists of grasslands of intermediate height and are often associated with clumped vegetation interspersed with patches of bare ground. Other habitat requirements include moderately deep litter and sparse coverage of woody vegetation.	No preferred nesting habitat exists for this species within the Assessment Area due to the lack of grasslands of intermediate height, therefore, potential for occurrence is unlikely.	No further analysis would be required for determination of effect.	"No Impact"

Species	Status	Environmental Baseline for Potential Habitat	Potential Habitat Presence/Species Potential for Occurrence within the Assessment Area	Species Analysis Required	Determination of Effect
Henslow's Sparrow (<i>Centronyx henslowii</i>)	Concern	The breeding habitat of the Henslow's Sparrow consists of open fields and meadows with grass interspersed with weeds or shrubby vegetation, especially in damp or low-lying areas, adjacent to salt marsh. This species utilizes unmowed hayfields and will abandon if cut. Found in a variety of habitats that contain tall, dense grass and herbaceous vegetation.	No preferred nesting habitat exists for this species within the Assessment Area due to routine vegetation maintenance and the lack of favored substrates used for nest success, therefore, potential for occurrence is unlikely.	No further analysis would be required for determination of effect.	"No Impact"
Bobolink (<i>Dolichonyx oryzivorus</i>)	Concern	The Bobolink has a large nesting range in North America that expanded with historical anthropogenic habitat changes. Breeding habitat includes tall grass areas, flooded meadows, prairie, deep cultivated grains, and hayfields. Nests are on the ground in small hollows in areas concealing herbaceous vegetation. Individuals tend to return to breed in the same area in successive years, especially if that site has had good bobolink productivity.	Preferred nesting habitat may exist for this species within the Assessment Area, therefore, potential for occurrence is unlikely.	No further analysis would be required for determination of effect.	"May Impact"
Prothonotary Warbler (<i>Protonotaria citrea</i>)	Concern	The Prothonotary Warbler breeds in mature deciduous floodplain, river, and swamp forests; wet lowland forest and requires dense underbrush along streambanks. Primary habitats are almost always near standing water and swamps that are somewhat open with scattered dead stumps are preferred. Bottomland forests and extensive willow thickets near lakes or ponds are also quite suitable. This species nests in cavity (natural, old woodpecker hole, bird box, etc.), in snag or living tree, often or always near or over water, at average height of 1.5-3 m (range 0.9-9.8 m).	No preferred nesting habitat exists for this species within the Assessment Area due to the lack of dense forested habitat, therefore, potential for occurrence is unlikely.	No further analysis would be required for determination of effect.	"No Impact"
Kentucky Warbler (<i>Geothlypis formosa</i>)	Concern	The Kentucky Warbler breeds in humid deciduous forests, dense second growth, and swamps; however, preferring forests with a slightly open canopy, dense understory, and well-developed ground cover.	No preferred nesting habitat exists for this species within the Assessment Area due to the lack of adequate forest habitat, therefore, potential for occurrence is unlikely.	No further analysis would be required for determination of effect.	"No Impact"

Species	Status	Environmental Baseline for Potential Habitat	Potential Habitat Presence/Species Potential for Occurrence within the Assessment Area	Species Analysis Required	Determination of Effect
Cerulean Warbler <i>(Setophaga cerulea)</i>	Concern	The Cerulean Warbler breeds in structurally mature hardwood forests in a mesic or wetter situation, with a closed canopy. The size of the trees is of primary importance and their species identity secondary. Landscape situation and context has a strong bearing on whether otherwise suitable breeding habitat will actually contain these warblers.	No preferred nesting habitat exists for this species within the Assessment Area due to the lack of adequate forest habitat, therefore, potential for occurrence is unlikely.	No further analysis would be required for determination of effect.	<i>“No Impact”</i>

Species descriptions were obtained by NatureServe Explorer and USFWS Environmental Conservation Online System (“ECOS”).

3.5.3.2 Environmental Consequences

Proposed Action Alternative:

Under the Proposed Action Alternative, implementation of the proposed Project within the Assessment Area may impede preferred nesting habitat favored by migratory birds. Based on the subsequent desktop analysis, a determination of “**May Impact**” has been made for the following migratory birds:

- Black-billed Cuckoo (*Coccyzus erythrophthalmus*)
- Red-headed Woodpecker (*Melanerpes erythrocephalus*)
- Loggerhead Shrike (Eastern) (*Lanius ludovicianus*)
- Bobolink (*Dolichonyx oryzivorus*)

Ground mounted solar arrays also pose little to no risk to migratory birds. Additionally, the solar panels proposed for use at this facility are designed to absorb the sunlight (PV panels) versus reflect the light; therefore, a reflective glare is not a concern for this facility. See Biological Assessment (“BA”) submitted separately from this document.

No Action Alternative:

Under the No Action Alternative, an undeveloped grass field would remain the primary land use within the Assessment Area.

3.5.3.3 Mitigation

Construction should be limited to timeframes when migratory birds are not present, otherwise, a qualified wildlife biologist should be employed to identify nest potential or presence of migratory birds. In the event a nest is located and occupied, the qualified wildlife biologist would assist the Client with the USFWS consultation process as well as avoidance/minimization strategies. A determination of “**No Impact**” has been made for all other migratory birds.

3.5.4 Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act (“BGEPA”) is enforced by the USFWS and makes it illegal for anyone to take, possess, import, export, transport, sell, purchase, barter, or offer for sale, purchase, or barter any Bald or Golden Eagle or the parts, nests, eggs of such bird except under the terms of a valid permit issued. The BGEPA also prohibits any activity that could cause injury to the species, nest abandonment, or a decrease in productivity. (USFWS Bald and Golden Eagle Protection Act, 2024).

3.5.4.1 Affected Environment

The Assessment Area primarily consists of an undeveloped, grass field with a wooded corridor along the northeastern and eastern boundaries of the site. At the time of the on-site investigation, the Assessment Area appeared to be used as a staging/storage yard due to observed dirt piles,

debris, and construction equipment. While Bald and Golden Eagles may be visitors to the area surrounding the Assessment Area, suitable nesting habitat, which includes tall, large diameter trees and preferred foraging areas including large, open expanses of water, are not present near the Assessment Area.

3.5.4.2 Environmental Consequences

Proposed Action Alternative

Under the Proposed Action Alternative, effects to Bald and/or Golden Eagles are not anticipated since the Assessment Area and surrounding areas do not contain preferred habitat to support the species.

No Action Alternative

Under the No Action Alternative, the project site would remain in its current condition resulting in no effects to Bald and/or Golden Eagles.

3.5.4.3 Mitigation

No mitigation measures are proposed since effects to Bald and/or Gold Eagles are not anticipated.

3.5.5 Invasive Species

EO 13112, *Invasive Species*, directs federal agencies to not authorize, fund or carry out actions believed to cause or promote the introduction or spread of invasive species unless the Agency determines that the benefits of such actions outweigh the potential harm caused by invasive species.

The possibility of an introduction of an invasive plant species may occur with any construction related activity. Disturbance of soil and vegetation in a project area provides an opportunity for invasive seeds to germinate. The USACE Kansas City District has developed an invasive species plant list for Kansas, which can be found at: <https://usace.contentdm.oclc.org/digital/api/collection/p16021coll11/id/2682/download>. The list includes 466 plant species as potentially occurring in the Kansas.

3.5.5.1 Affected Environment

The predominant vegetation on the Assessment Area includes Virginia wildrye (*Elymus virginicus*), silver bluestem (*Bothriochloa torreyana*), American elm (*Ulmus americana*), common hackberry (*Celtis occidentalis*), and American plum (*Prunus americana*). Vegetation management is limited mechanical mowing. Bare ground accounts for approximately fifty (50) percent of the Assessment Area.

3.5.5.2 Environmental Consequences

Proposed Action Alternative:

Given that only minor earthwork would be required for the construction of the Project and no fill material is being imported, the potential for the establishment and spread of non-native/invasive species is unlikely. Further, under the Proposed Action Alternative, the potential increase of invasive species is not anticipated. Vegetation must be maintained under the panel surface to prevent panel shading, which would be the responsibility of KPP Energy and would be performed on a scheduled interval.

No Action Alternative:

An undeveloped grass field would remain the primary land use within the Assessment Area. Herbicide applications would remove all unwanted vegetation, including invasive species.

3.5.5.3 Mitigation

The proposed Project would comply with the requirements of the EO by maintaining all possible existing ground cover and by seeding any disturbed area with a mixture of native herbaceous vegetation after construction which would discourage the establishment of non-native species and promote the restoration of native species.

3.6 Historic and Cultural Resources

This section provides an overview of historic properties and cultural resources near the Assessment Area and addresses potential effects to those resources that would be associated with the Project. Cultural Resources, following a National Park Service definition (National Park Service, 2024), includes the tangible remains of a prehistoric or historic human activity, occupation, or endeavor. These remains can represent a variety of resource types. Common resource types include districts, sites, buildings, structures, objects, and archaeological resources. Cultural resources comprise the physical remains themselves, the areas where significant human events occurred even if evidence of the event no longer remains, and the environment surrounding the actual resource. Potential effects to cultural resources can be direct or indirect. The National Historic Preservation Act requires federal agencies to consider effects to *historic properties* within an undertaking's area of potential effects ("APE"). *Historic Properties* (as defined in 54 USC 306108, and its implementing regulation, 36 CFR Part 800.6 and 800.16) are those cultural resources that are eligible for inclusion in the National Register of Historic Places (under 36 CFR 60.4). The Assessment Area correlates to the APE.

3.6.1 Affected Environment

To evaluate potential effects to the APE, a literature review and cultural resources inventory of the entire APE was completed (Milam, 2024). Human occupation of Kansas began over 12,000 years ago (Hoard and Banks, 2006). In the ensuing millennia, a variety of different people lived in the state. Following the Paleoindian and Archaic periods, Ceramic- and Plains Woodland-period tribes

occupied the region, influenced by cultures farther east (Adair, 1996; Bozell, 2006; Hoard and Banks, 2006; Vehik, 1984). Later occupations include those by people within the Central Plains, Plains Village, and Oneota traditions, and the Great Bend Aspect (Blakeslee and Hawley, 2006; Brosowske and Bevitt, 2006; Wedel, 1959). By the Protohistoric (AD 1450–1725) and Historical Indigenous (post AD 1725) periods, tribes occupying Kansas included the Wichita, the Kansa, Comanche, and Pawnee (Blakeslee and Hawley, 2006; Hoard and Banks 2006). Although centered farther east, the Kaw and Osage extended into Kansas as well. The U.S. Department of Housing and Urban Development’s Tribal Directory Assessment Tool (TDAT) suggests that tribes with an interest in Marion County include the Cheyenne and Arapahoe Tribes of Oklahoma, Osage Nation, Wichita, and Affiliated Tribes (Wichita, Keechi, Waco, & Tawakonie) of Oklahoma. Historical Euro-American entry into the state began in AD 1541, with occupation intensifying in the AD 1800s (Carrillo, 1990a, b, c; Hyslop, 2002). Settlement in Kansas increased following the end of the Civil War, and intensified after the construction of railways in the 1860s–1880s (Fraser and Strand, 1997). The completion of railroads, such as Kansas Pacific and the Atchison, Topeka & Santa Fe, allowed homesteading to expand greatly within the state. Since early homesteading, agriculture has remained a cornerstone of development in the region.

A file search was conducted through the Kansas State Historical Society (“KSHS”) on January 18, 2024. Prior to completing a cultural resources inventory of the APE, there were no known sites or historic properties within one (1) mile of the APE.

The cultural resource inventory area covered the 6.62-acre Assessment Area and included the excavation of 153 survey-level shovel tests. Only one cultural resource was documented during the inventory and was determined to be not eligible for inclusion into the National Register of Historic Places; thus, there is no effect to historic properties for the project. The cultural resource inventory report was provided to the USDA-RUS for review and, following completion of this review, provided to the Kansas Historical Society/State Historic Preservation Office and Tribal Historic Preservation Offices for review and comment (Table 4). Responses were received from Osage Nation and the Kansas State Historic Preservation Office (“SHPO”); the latter is operated as the Kansas Historical Society (“KHS”). Both the KHS and Osage Nation concurred with the USDA-RUS determination that a finding of no historic properties affected, in accordance with 36 CFR § 800.4(d)(1), was appropriate for the referenced project.

Table 4. Summary of Section 106 Consultation and Responses

Consulted Tribe/Historic Preservation Office	Consultation Notification Date	Consultation Response Date
Cherokee Nation	08/05/2024	None
Cheyenne and Arapaho Tribes, Oklahoma	08/05/2024	None
Osage Nation	08/05/2024	Concurrence letter (provided 09/04/2024)
United Keetoowah Band of Cherokee Indians in Oklahoma	08/05/2024	None

Wichita and Affiliated Tribes (Wichita, Keechi, Waco & Tawakonie), Oklahoma	08/05/2024	None
Kansas Historical Society/State Historic Preservation Office	08/05/2024	Concurrence letter (provided 8/16/2024)

3.6.2 Environmental Consequences

Proposed Action Alternative:

No Historic Properties exist in the APE; thus, the Project resulted in a *no historic properties affected* determination.

No Action Alternative:

Under the No Action Alternative, no surface disturbance would occur. No Historic Properties exist in the APE; therefore, the No Action Alternative also results in a *no historic properties affected* determination.[3.6.3 Mitigation](#)

Inadvertent Discoveries and Native American Graves Protection and Repatriation Act

Despite the fact that the Proposed Action Alternative has no effect to historic properties, there is a small possibility that artifacts or other cultural materials may still be present. If any artifacts are unearthed during construction, the proponent or their contractor would halt work immediately and contact the Kansas State Historic Preservation Office for further instructions. The inadvertent discovery of any human remains shall comply the Native American Graves Protection and Repatriation Act (“NAGPRA”) (25 U.S.C. §§ 3001 et seq.) and its implementing regulations (43 CFR 10) and the Archaeological Resources Protection Act of 1979 (“ARPA”) (16 USC 470 aa–mm) and its implementing regulations (43 CFR 7), as well as applicable Kansas state regulations (Section 126-1-2). The undertaking is not on federal lands and no Native American historic properties or cultural items were encountered or are expected. As such, a NAGPRA plan of action is not believed to be mandated, following 43 CFR 10.5.

3.7 Aesthetics/Visual Resources

This section describes an overview of the existing visual resources at the Assessment Area and the potential effects to those resources associated with the Project. Visual resources are the visual character of a place, both manmade and natural, that give a particular landscape its character and aesthetic quality.

As development in rural areas increases in scope and complexity, aesthetics or visual effects may be a concern. The visual quality of an area may be affected by the introduction of new buildings or structures. Where visual effects are identified, and avoidance of the affected area is not feasible, efforts should be made to design, construct and operate in such a way that would minimize aesthetic effects.

3.7.1 *Affected Environment*

The Project is located on land previously disturbed from agricultural activities and equipment storage. The Project is currently owned by the City of Marion. The proposed solar array would be located on rural, agricultural tracts of land outside of any aesthetically sensitive location such as a scenic vista, area, or park. Further, the Project is located immediately north of a city operated equipment staging area and a county transfer station. The Assessment Area is in the middle of an old defunct railroad transfer station. Bordering on two sides are old railroad tracts not currently in use. These tracts are elevated above the natural landscape and have been overcome by trees and vegetation in their abandonment.

3.7.2 *Environmental Consequences*

Proposed Action Alternative:

The Project would place PV panels over the approximately 6.62-acre site, outside of any scenic or otherwise aesthetically sensitive area. Due to the limited height of these PV structures and the existing land uses, no significant adverse effect to the aesthetics of the area are anticipated by the Proposed Action Alternative.

No Action Alternative:

Under the No Action Alternative, the Project Area would remain as an undeveloped grass field, resulting in no effects to aesthetics/visual resources of the area.

3.7.3 *Mitigation*

No mitigation measures are proposed since there would be no anticipated effects to aesthetics/visual resources with the implementation of the Project.

3.8 *Air Quality*

3.8.1 *Air Quality*

This section describes an overview of the existing air quality in the Assessment Area and the potential effects that would be associated with the Project.

Air quality management and protection responsibilities exist at the Federal, State and Local levels; however, the primary statutes that establish ambient air quality standards and establish regulatory authorities to enforce regulations designed to attain those standards are codified by the federal Clean Air Act (“CAA”).

The CAA and its amendments mandate requirements for managing air quality across the nation by establishing primary and secondary air quality standards. Primary air quality standards protect the public health, including the health of sensitive populations including people with asthma, children, and older adults. Secondary air quality standards protect public welfare by promoting ecosystem

health, damage to crops and buildings and preventing decreased visibility. Potential air quality effects can be short-term (construction-related) or long-term (facility emissions and increased traffic). (USEPA NAAQS Table, 2024).

3.8.1.1 Affected Environment

The National Ambient Air Quality Standards (“NAAQS”) for “criteria” pollutants including ozone (O₃), particulate matter (PM_{2.5} and PM₁₀), carbon monoxide (CO), nitrogen dioxide (NO₂), sulfur dioxide (SO₂) and lead (Pb). The NAAQS for these pollutants is listed in **Table 5** and represent the levels of air quality deemed necessary by the USEPA to protect the public health and welfare with an adequate margin of safety.

Table 5: National Ambient Air Quality Standards

Pollutant	Averaging Time	Level	Form
Carbon Monoxide (CO)	8 hours	9 ppm	Not to be exceeded more than once per year
Carbon Monoxide (CO)	1 hour	35 ppm	Not to be exceeded more than once per year
Lead (Pb)	Rolling 3-month average	0.15 µg/m ³	Not to be exceeded
Nitrogen Dioxide (NO₂)	1 hour	100 ppb	98 th percentile of 1-hour daily maximum concentrations, averaged over 3 years
Nitrogen Dioxide (NO₂)	1 year	53 ppb	Annual mean
Ozone (O₃)	8 hours	0.070 ppm	Annual fourth-highest daily maximum 8-hour concentration, averaged over 3 years
Particle Pollution (PM_{2.5})	1 year	12.0 µg/m ³	Annual mean, averaged over 3 years
Particle Pollution (PM_{2.5})	1 year	15.0 µg/m ³	Annual mean, averaged over 3 years
Particle Pollution (PM_{2.5})	24 hours	35 µg/m ³	98 th percentile, averaged over 3 years
Particle Pollution (PM_{2.10})	24 hours	150 µg/m ³	Not to be exceeded more than once per year on average over 3 years
Sulfur Dioxide (SO₂)	1 hour	75 ppb	99 th percentile of 1-hour daily maximum concentrations, averaged over 3 years
Sulfur Dioxide (SO₂)	3 hours	0.5 ppm	Not to be exceeded more than once per year

The USEPA Green Book provides detailed information about area NAAQS designations, classifications, and nonattainment status. Established under the CAA, the General Conformity Rule plays an important role in helping states improve air quality in those areas that do not meet the NAAQS. These regulations require that projects in federal nonattainment areas that could be built with funding from a federal agency such as the RUS must demonstrate conformity with the applicable state or local attainment plan. To date, Marion County is not currently listed as a

nonattainment or maintenance area; therefore, is in conformance with the State Implementation Plan for air quality. See EPA Green Book Report in **Appendix H** as **Exhibit H-1**.

3.8.1.2 Environmental Consequences

Proposed Action Alternative:

Under the Proposed Action Alternative, the Project would not generate air emissions from a stationary source. The given nature of a solar energy generating facility during operation would not contribute to air pollution and would not result in a conflict or obstruction of an air quality plan. Short-term, potential air quality effects may result from the minor earthmoving and construction activities during the construction phase. Earthwork and construction emissions would have a temporary effect; consisting of mainly dust generated during movement of soils and other construction activities, and exhaust emissions from construction-related equipment and vehicles.

The Project would produce electricity with no direct air emissions of greenhouse gases or other air pollutants, and very low life-cycle emissions relative to traditional fossil fuels. In the long-term, there would be a reduction in harmful greenhouse gas emissions by reducing the energy demand from traditional fossil fuel sources in the area, which should improve air quality in the region.

Proposed No Action Alternative:

Under the No Action Alternative, an undeveloped grass field would continue to be the primary land use.

3.8.1.3 Mitigation

Dust suppression techniques (e.g., covering or spraying bare soils with water) would be used to control dust resulting from construction activities. Post-construction, disturbed soils would be seeded with native herbaceous species.

3.9 Socioeconomics and Environmental Justice

USDA Departmental Regulation DR-5600-2, *Environmental Justice* and EO 12898, *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations*, require that federal agencies, whenever feasible, maintain information of populations by race, national origin or income and would use this information to determine whether their actions have disproportionately high and adverse human health or environmental effects on minority or low-income populations. Additionally, the socioeconomic conditions of the Project Area are analyzed for any potential effects associated with the construction and operation of the Project. Factors considered in this analysis include population, employment, and income.

3.9.1 Affected Environment

The USEPA's Environmental Justice Screening and Mapping Tool ("EJScreen") and data from the U.S. Census Bureau ("USCB") were utilized to determine the possible socio-economic effects

and environmental justice effects of minority and low-income populations for the proposed Project and surroundings. According to the EJSscreen Summary Report, included as **Exhibit D-1** in **Appendix D**, the total population of the Assessment Area and a 1-mile radius is 1,507. According to the USCB American Community Survey (“ACS”), the area’s race makeup is White (approximately 92%), Hispanic (approximately 5%), and Black (approximately 1%). The area’s population is distributed with 8% aged 1-4, 23% from 5 to 19, 77% from 20 to 64 and 27% over the age of 65. According to the USCB ACS, the average per capita income for the City of Marion is \$38,238 with 35% of individuals classified as “Low Income”. (USCB ACS Marion City, Marion County, Kansas, 2022).

3.9.2 Environmental Consequences

Proposed Action Alternative:

Under the Proposed Action Alternative, effects related to socioeconomic and environmental justice are not anticipated. Since the Project does not include the addition of new homes or businesses, implementation of the Project would not directly stimulate unplanned population growth in the Assessment Area. Local residents would not notice a change in shifts in population movement and growth, or effect on public service demands. The Project should not adversely or significantly affect low income or minority populations but should provide positive economic effects by expanding the tax base in Marion County as well as provide a source of affordable, renewable energy.

Proposed No Action Alternative:

Under the No Action Alternative, an undeveloped grass field would continue to be the primary land use. Effects to low income or minorities would not change.

3.9.3 Mitigation

No mitigation measures are proposed since low-income or minority populations would not be affected by the Project.

3.10 Miscellaneous Concerns

3.10.1 Noise

This section describes an overview of the existing ambient sound environment at the Assessment Area and the potential effects that would be associated with the Project. Noise is an unwanted or unwelcome sound added to the natural acoustic setting of a locale. The most common unit of sound is the decibel (“dB”), a logarithmic measure of sound pressure. However, the human ear is not equally sensitive to all sound frequencies. The A-weighted decibels (“dBA”) scale, weighted approximately to the sensitivity of the human ear, quantifies this subjective noise level perception. Approximating the range of human hearing, the dBA scale ranges from 0 dBA to about 140 dBA. The softest sound heard by a person with average hearing is 0 dBA; 20-30 dBA is a rural farm;

40-50 dBA is a peaceful subdivision; 70-80 dBA is an urban freeway shoulder; and 110 dBA is equivalent to thunder (KSDOT, 2024).

In addition, noise levels are perceived differently at night, between 10pm and 7am, with noise levels perceived as more disruptive during normal sleeping hours. This difference is reflected by artificially increasing the perceived volume by 10 dBA. The day-night-sound level is measured in Ldn, a weighted 24-hour average noise level to describe a receptor's cumulative noise exposure. An Ldn at or below 65 dBA is typically applied as suitable for residential use. Similarly, the Community Noise Equivalent Level ("CNEL") weights 7pm to 10 pm with an additional 5 dBA along with the Ldn weight of 10 dBA between 10pm and 7am. The CNEL is typically approximated as 0.5 dBA higher than the Ldn. The EPA recognizes noise levels below an Ldn of 55 dBA as having no adverse impact (EPA, 1974).

The Federal Noise Control Act of 1972 (Public Law 92-574) established that all Federal agencies administer their programs to promote an environment free of noise that would jeopardize public health or welfare. In 1974, in response to the requirements of the Federal Noise Control Act, the EPA identified indoor and outdoor noise level limits to protect public health and welfare (communication disruption, sleep disturbance, and hearing damage). Outdoor and indoor noise exposure limits of 55 dB Ldn and 45 dB Ldn, respectively, are identified as desirable to protect against speech interference and sleep disturbance for residential, educational, and healthcare areas. The sound-level criterion identified to protect against hearing damage in commercial and industrial areas is 70 dB 24-hour Ldn (both outdoors and indoors).

The construction of the Project could create noise effects. Certain activities inherently produce sound levels or characteristics that have the potential to create noise. There are two main categories of noise – community noise and job-related noise. Job related noise is regulated by the Occupational Safety and Health Administration ("OSHA") (Occupational Safety and Health Administration, Occupational Noise Exposure, 2024). The other category, community noise, refers to the combination of multiple sources of noise which may result in an overall unacceptable level for those living, working, or recreating in the area especially in noise-sensitive areas including residences, schools, hospitals, churches, parks, wildlife refuges, etc.

3.10.1.1 Affected Environment

The Assessment Area is in Marion County, Kansas within the city limits for Marion. Ambient noise at the Assessment Area consists predominantly of rural or natural sounds, as well as manmade noise from vehicle traffic traveling on local roads and highways. The Project would be in incorporated areas, including residences, located within 500 feet of the Assessment Area. Frequent movement of materials and equipment are currently a large part of the community noise associated with this area.

3.10.1.2 Environmental Consequences

Proposed Action Alternative:

Under the Proposed Action Alternative, there would be a direct, short-term increase in noise related to construction activities. According to the American National Standards Institute (“ANSI”), average construction sound levels range between 80-90 decibels (“dBA”) (ANSI, 2018) – this singular effect would be temporary, occurring only during daytime hours within the 4 to 6-month construction period. Post-construction, the ambient sound environment would be expected to return to existing levels. Noise from equipment (i.e., the inverter) would only be audible during the daylight hours when the panels are producing power and would likely only be heard by individuals within the perimeter fence. Consequently, the Project would only cause temporary noise effects and would not result in a long-term increase to the ambient noise levels of the area.

No Action Alternative:

Under the No Action Alternative, noise levels would remain unchanged.

3.10.1.3 Mitigation

No mitigation measures are proposed since noise would be negligible during construction and virtually non-existent once the Project is operational. Noise due to construction would adhere to OSHA regulations.

3.10.2 Transportation and Traffic

This section provides an overview of the existing traffic and transportation resources near the Assessment Area and describes the potential effects the Project could have on these resources.

Transportation effects include increases and decreases in traffic and transportation that might be caused or exacerbated by development of the Project. Other effects considered are the transportation of materials to or from the facility either during construction or during operation. Any possible changes in transportation patterns or intensity are also evaluated.

3.10.2.1 Affected Environment

The Project would be located northwest of the intersection of West Washington Street and Vine Street. Access to the Project would be from West Washington Street, which is a paved road at the Assessment Area. The nearest highway to the Assessment Area is State Highway 256, which is located to the north of the Assessment Area and is accessible by Walnut Street. Kansas Department of Transportation (“KDOT”) does not have an average daily traffic counts for the area; however, the average daily traffic count for State Highway 256 is 1,260 vehicles in 2022 (Kansas Department of Transportation: Traffic Count Maps, 2024). The nearest railroad line is located approximately 50-feet east of the Assessment Area identified as Union Pacific Railroad and the nearest municipal airport is the Marion Municipal Airport located approximately 2.25 miles southeast of the Assessment Area.

3.10.2.2 *Environmental Consequences*

Proposed Action Alternative:

Under the Proposed Action Alternative, significant effects to traffic and transportation would not result due to the implementation of the Project, given the short duration of the construction phase and the limited number of workers and equipment required for operation and maintenance. Most of the traffic burden, due to the Project, would occur during the construction phases. During these short duration phases, it is anticipated that traffic would increase slightly to account for construction personnel and equipment. A significant increase in traffic for any maintenance or inspection activities is not anticipated. Construction traffic would resume to pre-project levels once construction is complete.

No Action Alternative:

Under the No Action Alternative, traffic in the area would remain unchanged.

3.10.2.3 *Mitigation*

No mitigation measures are proposed since effects to traffic and airports are not anticipated.

3.11 Human Health and Safety

This section describes public health and safety associated with the construction and operation of the Project and the potential effects. There is an importance in evaluating the Project's effect on public health and safety per 40 CFR Part 1508.27. The Project would require all personnel and visitors to follow the OSHA guidelines during construction and operation.

3.11.1 Electromagnetic Fields and Interference

Electromagnetic fields ("EMF") contain both electric and magnetic fields. Electric fields are forces that electric charges exert on other electric charges. Electric fields are produced by voltage, the potential to do work, and are measured in volts per meter ("V/m") or kilovolts per meter (1000 V/m or "kV/m"). Flow of current results in a magnetic field measured in gauss ("G") or milligauss ("mG"). While an electric field is easily shielded by conducting objects (including magnetic soil, trees, and buildings), a magnetic field is not easily weakened by most materials. There are several sources of EMF in common items that are used every day. See **Table 6** for the common sources of magnetic fields and the EMF intensity they can generate.

Table 6: Common Sources of Magnetic Fields (mG)

Sources*	Distance From Source (6 inches (mG))	Distance from Source (24 inches (mG))
Microwave Oven	100-300	1-30
Dishwasher	10-100	2-7
Refrigerator	Ambient – 40	Ambient – 10
Flourescent Light	20-100	Ambient – 8
Copy Machine	4-200	1-13

Drill	100-200	3-6
-------	---------	-----

Source: NIEHS, 2002

*Different makes and models of appliances, tools, and/or fixtures will produce different levels of magnetic fields. These are generally accepted ranges.

The strength of EMF from transformers, capacitor banks, and substations decreases rapidly with distance. Typically, the EMF produced from a substation is indistinguishable from background beyond the fence. Generally, the strongest EMF around the outside of a substation is generated from the power lines connected to the substation (NIEHS, 2002), which for the Project would be buried below the ground. Table 7 depicts the strength of both electric and magnetic fields decreasing rapidly with distance from the source. **Table 8** depicts the distance EMFs travel and the decrease in intensity for underground transmission lines.

Table 7: Typical US Magnetic Fields Levels Associated with Transmission Lines

Sources*	Usage	Typical Magnetic Field Measurement (mG) Maximum in ROW	Approximate Distance from Centerline – 50 feet (mG)	Approximate Distance from Centerline – 100 feet (mG)	Approximate Distance from Centerline – 200 feet (mG)
115 kV Overhead	Average	30	7	2	0.4
115 kV Overhead	Peak	63	14	4	0.9
230 kV Overhead	Average	58	20	7	1.8
230 kV Overhead	Peak	118	40	15	3.6
500 kV Overhead	Average	87	29	13	3.2
500 kV Overhead	Peak	183	62	27	6.7

Table 8: Typical Magnetic Field Levels Associated with Underground Transmission Lines in the UK

Underground Transmission Lines Voltage	Details	Load	Maximum in ROW (mG)	Approximate Distance from Centerline – 16 feet (mG)	Approximate Distance from Centerline – 33 feet (mG)	Approximate Distance from Centerline – 66 feet (mG)
132 kV	Single cable buried 1-meter below the surface	Typical	50	17.8	9.4	4.7
275 kV	Direct buried with 0.5-meter spacing and 0.9-	Typical	241	33	9	2.3

	meter deep					
275 kV	Direct buried with 0.5-meter spacing and 0.9-meter deep	Maximum	962	131	36	9.2

Source: PSCW, 2017

3.11.1.1 Affected Environment

The Proposed Action Alternative is located within the City of Marion; however, is characterized rural in nature. The nearest residential structure is located approximately 0.08 miles outside the eastern boundary. An existing overhead electrical powerline parallels West Washington Street approximately 25 feet south of the project boundary.

3.11.1.2 Environmental Consequences

Proposed Action Alternative:

Because a correlation between EMF exposures and public health hazards has not been established, Federal and most state health regulatory agencies have determined not to set numeric exposure limits for EMFs. An American organization, the International Commission of Electromagnetic Safety/Institute of Electrical and Electronics Engineers, publishes exposure limits including an exposure limit of 2,000 mG or 5 kV/m (TasNetworks, 2023). The State of Kansas does not have an exposure limit to EMFs.

The Proposed Action Alternative would not include overhead high-voltage electric transmission lines, substations, cell, or microwave towers. The current scientific literature suggests that electromagnetic fields that are generated from similar solar facilities operate below acceptable exposure levels, with the highest EMFs present at three (3) feet of distance from the inverter units used. The proposed solar array for this Project is located over 1,000 feet from the nearest occupied residence and a security fence would be installed around the perimeter of the property to prevent unauthorized access on the Property. As a result, the Project would have no impact to human health and safety because of EMFs.

Possible negative effects from the Project to human health would be limited to the dangers associated with the construction and installation of the facility itself. Post-construction, little to no danger would be posed by the facility beyond that of the potential for electric shock. Prevention measures regarding electrical safety would be followed just as with any commercial scale energy facility.

No Action Alternative:

Under the No Action Alternative, no change to EMF exposure would occur.

3.11.2 Environmental Risk Management

Environmental risk management informs Agency staff on the proper procedures for environmental due diligence relating to hazardous substances, hazardous wastes, and petroleum waste products. If properly conducted, environmental risk management proactively recognizes potential hazards and legal and financial vulnerabilities associated with the major hazardous materials, federal and state laws, as well as possible hazards to the human environment in compliance with NEPA.

3.11.2.1 *Affected Environment*

Environmental due diligence is the process of inquiring into the environmental condition of real property to determine the potential for contamination and/or recognized environmental conditions (“REC”). An onsite investigation of the Assessment Area was conducted on January 31, 2024 to fulfill the requirements for a Phase I Environmental Site Assessment (“ESA”). The findings from the on-site investigation and database research were summarized in a Phase I ESA report dated March 26, 2024. The Phase I ESA report was performed in accordance with the procedures included in American Society for Testing and Materials (“ASTM”) E-1527-21, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process*. The Phase I ESA report has been submitted separately from this document.

3.11.2.2 *Environmental Consequences*

The assessment revealed no RECs associated with the Assessment Area. Based on the information obtained from the Phase I ESA investigation, the report concluded that further Environmental Site Assessment (Phase II) is unwarranted. Phase I ESAs are valid for 180 days. An update to the Phase I ESA would be required prior to project commencement.

Proposed Action Alternative:

Under the Proposed Action Alternatives, no change to human health and safety would occur.

No Action Alternative:

Under the No Action Alternatives, no change to human health and safety would occur.

3.11.2.3 *Mitigation*

Safety at the Project would be managed by strict adherence to OSHA requirements. Procedures in an emergency response plan would include management efforts, a Hazardous Operations Manual, and Spill Control and Countermeasures (“SPCC”) plans designed to protect workers and the public from exposure to hazards.

3.11.3 Reflectivity, Glare, or Dazzle

Reflectivity refers to light that is reflected off surfaces. The potential effects of reflectivity are glint, glare, or dazzle, which can cause a brief loss of vision. According to the Federal Aviation

Authority (“FAA”), solar energy projects introduce new visual surfaces to the airport setting, where reflectivity could result in glare that cause flash blindness episodes for pilots and air traffic controllers. (Federal Aviation Authority FAA Issues Policy on Solar Projects on Airports, 2021).

3.11.3.1 Affected Environment

PV panels would be placed within the 6.62-acre Assessment Area occupying almost the entirety of the site, which could produce reflectivity, glare, or dazzle.

3.11.3.2 Environmental Consequences

Proposed Action Alternative:

The amount of reflectivity varies among solar technologies. The Project would reduce reflectivity by utilizing PV panels, which are primarily absorptive compared to concentrated solar power technologies. Lastly, the Project does not include lighting; therefore, the Project would not result in light exposure or result in light pollution or glare. Additionally, due to the significant distance of identified airports in proximity to the Assessment Area, (e.g., Marion Municipal Airport is approximately 2.25 miles from the Assessment Area), glint, glare, and dazzle should not be a concern to aviation (pilots or air traffic controllers) with the implementation of the Project.

No Action Alternative:

Under the No Action Alternative, glint, glare or dazzle would not occur. Therefore, no effects would be anticipated.

3.11.3.3 Mitigation

No mitigation measures are anticipated since anticipated effects from reflectivity, glare, or dazzle would be negligible to local airport(s).

4.0 CUMULATIVE EFFECTS

Construction of the Project is anticipated to last six (6) months. After construction, the Project is expected to operate for 35 years. After decommissioning the project, KPP Energy would reclaim the Project Area. The temporal scale for cumulative effects is 36 years to account for the construction and operation periods.

The purpose of the Cumulative Effects Analysis is to assess if the Proposed Action Alternative would have significant effects on resources in combination with other past, present, or foreseeable future actions. All resource effects would be combined with the resources and actions in the area of similar geographic effects to the human environment.

The overall impact of this Project on the local environment when examined holistically mainly involves the disturbance of the agricultural lands, soils, and vegetation. The grading of the landscape and removal/re-distribution of the soils is the most vulnerable stage of the Project and

would be associated with primarily negative environmental effects such as surface water runoff increasing alongside erosion potential and encroachment of invasive plant species. However, these effects would be temporary and long-term effects can be avoided with the planting of a native seed mix beneath the panels to hold the soil in place and redevelop the soil profile as root matrices grow. The result would be increased water infiltration and competition with invasive species as well as the revitalization of soil bio-chemical nutrient cycles and horizon development. By the end of the project lifespan soil health would be expected to be similar to or better than existing conditions.

4.1 Future Projects

Desktop research of potential past, present, and future actions in the vicinity of the Proposed Action Alternative was completed. Resources reviewed included:

- City of Marion Website: <https://www.marionks.net/>
- City of Marion Legal Notices and Publications
- City of Marion City Council Agendas and Minutes

There are no known developments proposed in the City of Marion.

4.2 Cumulative Effects Analysis

The cumulative effects analysis includes actions that meet the following criteria:

- The action effects a resource potentially affected by the Proposed Action Alternative.
- The action causes effects within all or parts of the same geographic scope of the Proposed Action Alternative.
- The action causes effects within all or part of the temporal scope for the potential effects from the Proposed Action Alternative.

The Proposed Action Alternative is not expected to have significant effects to land use, floodplains, wetlands, water resources, biological resources, cultural and historic properties and cultural resources, aesthetics, air quality, socioeconomics/environmental justice, noise, transportation, health and safety, corridors, or soils. effects to the resources analyzed in Section 3 would mostly be localized to the Project Area, with most of the effects occurring during the six (6)-month-long project construction period.

As stated in Section 4.1, there are no known development projects in the City of Marion and therefore would have no cumulative effects associated with the Proposed Action Alternative. However, a future development within the City of Marion is always a possibility. A review of possible unexpected developments is included per resource section below.

4.2.1 Land Use

The surrounding area is mostly agricultural and undeveloped with residential lots to the east. Other land uses include industrial and commercial buildings to include the transfer station, the VFW Hall and RV Park, and the rail line to the south and east, all of which are not likely to change

significantly over the life of the Project. It is possible the development of the Proposed Action Alternative could spur additional solar development in the area over time. However, given the Kansas Emission Reduction and Mitigation Plan (KDHE, 2024), additional solar development in the region is likely regardless of the development of the Proposed Action Alternative. It is assumed other projects would result in similar land use changes in the vicinity. Therefore, the activities associated with the Proposed Action Alternative could have a minor cumulative effect on land use including prime farmlands in the vicinity when combined with other reasonably foreseeable planned and approved development actions.

4.2.2 Floodplains

Based on the Proposed Action Alternative's site plan, no permanent structures would be placed in a 100-year floodplain. The solar panels and associated infrastructure would be located with the FEMA delineated Zone X, Area of Limited Flood Risk due to Levee. Following the useful life of the solar facility, the facilities would be decommissioned and removed from the site. Other planned and approved development projects in the area also would be expected to adhere flood standards and regulations. As a result, no cumulative effects on floodplains and flooding are expected from the construction of the Proposed Action Alternative when combined with other reasonably foreseeable actions in the vicinity.

4.2.3 Wetlands

The Proposed Action Alternative was designed to avoid wetland effects. It is assumed that other projects in the area would also comply with Federal, state, and local regulatory requirements to avoid or minimize wetland effects for actions subject to regulatory requirements. The potential construction of additional developments in the area may add to incremental loss of wetlands; however, it is expected that the effects to wetlands during the construction of other projects would be permitted and the cumulative effects would be mitigated, as necessary, under applicable Federal, state, and local requirements and carried out in accordance with applicable construction permits. As a result, minor adverse cumulative effects to wetlands are expected from the construction of the Proposed Action Alternative when combined with other reasonably foreseeable actions in the vicinity, but would be mitigated according to Federal, state, and local regulatory requirements.

4.2.4 Water Resources

Adherence to regulatory requirements during construction and operation of the Proposed Action Alternative and other reasonably foreseeable projects would not substantially degrade surface or groundwater quality. Implementation and adherence to BMPs and other measures employed by all reasonably foreseeable projects is expected to result in short-term negligible effects to water resources during construction and decommissioning, and long-term negligible effects to surface water during operations in their immediate vicinities. The Proposed Action Alternative would have negligible effects on surface water and a minor effect to groundwater storage reduction, drawdown, subsidence, and yield resulting in a minor incremental impact on water resources. As a result, minor adverse cumulative effects to surface water or groundwater are expected from the construction of the Proposed Action Alternative when combined with other reasonably foreseeable

planned and approved development actions in the vicinity, but would be mitigated according to Federal, state, and local regulatory requirements.

4.2.5 Biological Resources

4.2.5.1 Threatened and Endangered Species, Other Protected Species, and Wildlife

The Proposed Action Alternative would not contribute to habitat loss from present and reasonably foreseeable project trends and actions. Project-related disturbance would be temporary and the potential for an increase in pollinator habitat is possible with the increase in vegetation diversity. Effects to special-status species within the Proposed Action Alternative's project area would be limited or minimized through the implementation of BMPs, design features, and mitigation measures to the extent practicable. As detailed in Sections 3.5.2, 3.5.3, and 3.5.4, no effects to threatened or endangered species or other protected species are anticipated with the implementation of the Proposed Action Alternative. Consequently, the Proposed Action Alternative would result in no cumulative effects to threatened and endangered species or other protected species when combined with reasonably foreseeable actions in the vicinity.

Direct effects to most wildlife species from the Proposed Action Alternative would be temporary and short-term or would be considered insignificant. The Proposed Action Alternative has been designed to avoid sensitive wildlife habitat to the extent practicable. Additional development in the area would add to this threat to wildlife where development would result in permanent habitat loss or conversion. However, it is assumed that BMPs of planned or proposed projects in the area would use avoidance measures and adhere to Federal, state, and local permit requirements. Adherence to permit requirements as well as application of BMPs would minimize potential cumulative adverse effects associated with new construction. As a result, no adverse cumulative effects to wildlife are expected.

4.2.5.2 Vegetation and Invasive Species

Cumulative effects to vegetation from the Proposed Action Alternative could occur where other existing and reasonably foreseeable trends and actions occur within the proposed area. Current vegetative conditions in the project vicinity are consistent with routinely maintained grassland. Reasonably foreseeable future actions in the Assessment Area could result in altered species composition; however, with the implementation of a native pollinator seed mix designed for the solar application, an increase in the number of plant species and relative frequencies of occurrence for some plants and thus an increase in overall plant diversity may occur. The routinely maintained grassland would represent the largest vegetation community affected by implementation of the Proposed Action Alternative. The Proposed Action Alternative could also influence factors affecting vegetation growth (e.g., revegetation, root formation, exposure to spills, and watering via dust abatement) and invasive species and noxious weed encroachment. However, BMPs and design features would be applied to minimize adverse effects associated with vegetation and the introduction of invasive species. The Proposed Action Alternative may be decommissioned, and the routinely maintained grassland condition would be restored following the useful life of the solar facility. Therefore, the Proposed Action Alternative when combined with other present and reasonably foreseeable actions in the vicinity would have a negligible cumulative effect on vegetation.

4.2.6 Historic and Cultural Resources

The Proposed Action Alternative would have no adverse effect on NRHP-eligible resources in the APE. The specific effects of the reasonably foreseeable projects on NRHP-eligible resources is unknown; however, it is assumed that effects to such resources would be avoided to the extent practicable and that appropriate mitigation would be implemented if effects cannot be avoided. Therefore, the Proposed Action Alternative when combined with other present and reasonably foreseeable actions in the vicinity would not be expected to contribute to cumulative effects to historic and/or cultural resources.

4.2.7 Aesthetics/Visual Resources

The PV arrays associated with the Proposed Action Alternative would be limited in height and would have no effect on the surrounding aesthetics and/or visual resources of the landscape. Further, the reasonably foreseeable additional solar development that may be spurred by this project, provided the PV arrays are constructed in a similar fashion, should also have no effect on the surrounding aesthetics and/or visual resources of the landscape.

4.2.8 Air Quality

Construction and decommissioning activities associated with the Proposed Action Alternative, as well as with the reasonably foreseeable projects, would result in a temporary increase in criteria pollutant and ozone precursor emissions in the form of both fugitive dust from ground disturbing activities and exhaust emissions from the use of construction equipment and operation of worker vehicles and vendor and haul trucks. With the implementation of BMPs to control emission and any mitigation measures as needed, cumulative effects on air quality or climate in association with construction and decommissioning of the Proposed Action Alternative in conjunction with the construction of other projects would have no effect on the overall air quality or climate for the area.

4.2.9 Socioeconomics and Environmental Justice

The direct effects to the economy associated with the Proposed Action Alternative is expected to be minor, long-term, and beneficial. The development of other planned and approved projects is expected to have similar minor to moderate beneficial effects on the local economy depending on the size and type of project. Therefore, the Proposed Action Alternative is anticipated to contribute minor cumulative beneficial effects and long-term beneficial socioeconomic effects to the local economy when combined with reasonably foreseeable planned and approved actions in the vicinity. There would be no disproportionately high and adverse environmental or economic effects on minority or low-income populations. Given the distance between the reasonably foreseeable projects and the Proposed Action Alternative, it is not anticipated that project-related environmental justice effects would coincide with those from other projects in the immediate vicinity of Proposed Action Area. Therefore, the Proposed Action Alternative is not anticipated to result in more than negligible cumulative effects to the environmental justice communities when combined with reasonably foreseeable actions in the vicinity.

4.2.10 Noise

If construction of the Proposed Action Alternative overlaps construction of any unanticipated future projects in the vicinity, it is possible they may contribute to a temporary, cumulative increase in noise if construction vehicles utilize some of the same roadways. This impact would be minor and temporary. Operational noise is not anticipated at the facility that would coincide with other planned and approved projects in the immediate vicinity of the proposed project. Therefore, the Proposed Action Alternative is not anticipated to result in more than minor contributions to cumulative noise effects when combined with reasonably foreseeable actions in the vicinity.

4.2.11 Transportation and Traffic

It is not anticipated that project-related traffic would coincide with that from other unanticipated future projects in the immediate vicinity of Proposed Action Alternative. With mitigation, the resulting long-term transportation related effects associated with operation of the Proposed Action Alternative would be negligible. Therefore, the Proposed Action Alternative is not anticipated to result in more than minor contributions to cumulative effects to transportation when combined with reasonably foreseeable actions in the vicinity.

4.2.12 Electromagnetic Fields

There are currently no other known PV arrays planned for the project vicinity. The Proposed Action Alternative may indirectly spur additional construction of solar arrays in the future. It is also assumed that the additional projects would be situated away from residential developments and the electromagnetic fields and interference would be evaluated; therefore, the potential for electromagnetic fields and interference effects would be minimal. For these reasons, the Proposed Action Alternative is anticipated to make a negligible contribution to cumulative effects from electromagnetic fields and interference.

4.2.13 Environmental Risk Management

Because the Proposed Action Alternative includes property used for agricultural purposes, residual pesticides may remain in shallow soils. Similar conditions could be present at other planned and approved project sites. Public and worker health and safety hazards during construction and decommissioning activities would have an increased safety risk, which would be mitigated through implementation of health and safety plans, BMPs, and adherence to OSHA regulations. It is assumed that other reasonably foreseeable projects in the vicinity would employ similar measures to mitigate health and safety risks. Minimal human health or safety hazards would be anticipated because of the Proposed Action Alternative's operations. Overall, effects to human health and safety in association with implementation of the Proposed Action Alternative would be short-term, occurring only when workers are present and working at the site, and would be minor. Therefore, the Proposed Action Alternative is not anticipated to result in more than minor contributions to overall health and human safety.

Under the Proposed Action Alternative, the Project would have both short-term (temporary) and long-term direct effects – these effects are expected to be minor, insignificant, and would unlikely

contribute to cumulative effects. The following table (**Table 9**) provides a summary of potential effects associated with the implementation of the Project.

4.3 Summary of Environmental Effects

Because the Proposed Action Alternative includes property used for agricultural purposes, residual pesticides may remain in shallow soils. Similar conditions could be present at other planned and approved project sites. Public and worker health and safety hazards during construction and decommissioning activities would have an increased safety risk which would be mitigated through implementation of health and safety plans, BMPs, and adherence to OSHA regulations. It is assumed that other reasonably foreseeable projects in the vicinity would employ similar measures to mitigate health and safety risks. Minimal human health or safety hazards would be anticipated because of the Proposed Action Alternative operations. Overall, effects to human health and safety in association with implementation of the Proposed Action Alternative would be short-term, occurring only when workers are present and working at the site, and would be minor. Therefore, the Proposed Action Alternative is not anticipated to result in more than minor contributions to overall health and human safety.

Table 9 provides a summary of potential environmental effects associated with the implementation of the Project.

Table 9: Summary of Environmental Effects

Resource	Determination of Effect for the Proposed Action Alternative
General Land Use	Land use would change from an undeveloped maintained grassland to a renewable energy facility; however, potential future land use conversion would be considered minor resulting in no significant adverse effects. Landownership would not change.
Important Farmland	Approximately 6.62 acres of Prime Farmland would be converted to non-agricultural use; however, the Assessment Area is within the city limits for Marion, Kansas which results in an exemption status – results in no adverse effect.
Formally Classified Lands	The Project would occur within land owned by the municipality, all components of the Project would be approved by the city council – results in no effect.
Floodplains	The Project would be located in a FEMA delineated flood zone – Zone X, Area of Reduced Flood Risk Due to Levee. The Project would not result in effects that would increase the Zone X flood elevation or present barriers to floodway passage.
Wetlands	Wetlands are present within the Assessment Area – avoidance is anticipated resulting in no potential effects to aquatic features.
Water Resources	The Project would not result in significant adverse effects to water resources; however, necessary stormwater and erosion controls would be utilized during construction to minimize the potential for runoff and siltation and effects to a WHPA.
Coastal Resources	Coastal resources are not present within the Assessment Area – results in no effect.
Biological Resources – General Biological Resources	The Project would not result in significant adverse effects due to minimal impervious surfaces being designed, lack of vegetation clearing, and the limited use of water.
Biological Resources – Listed Threatened and Endangered Species	The Project would not result in adverse effects to listed threatened or endangered species based on the lack of suitable habitat and protected species' requirements. Additionally, no designated critical habitat for listed species occurs within the Assessment Area nor would critical habitat be affected by the Project.
Biological Resources – Migratory Birds	Implementation of the proposed Project within the Assessment Area may impede preferred nesting habitat favored by migratory birds. However, construction would

Resource	Determination of Effect for the Proposed Action Alternative
	be limited to timeframes when migratory birds are not present, otherwise, a qualified wildlife biologist would be employed to identify nests or presence of migratory birds.
Biological Resources – Bald and Golden Eagles	The Project would not result in significant adverse effects to Bald or Golden Eagles based on the lack of suitable habitat for the species.
Biological Resources – Invasive Species	The Project would not result in significant adverse effects due to the routine maintenance of the Assessment Area and the lack of opportunity for establishment of invasive species.
Historic and Cultural Resources	A field assessment for the Project and consultation with the Kansas SHPO and interested Tribes was performed. The Kansas SHPO and the Osage Nation concurred with the findings. No effects to historic properties or cultural resources are anticipated.
Aesthetics/Visual Resources	A change in the visual character of the Assessment Area would occur; however, the change would not result in a significant adverse effect given the estimated height of the array and lack of public views or scenic areas.
Air Quality	The Project would result in temporary effects during construction (i.e., fugitive dust); however, would result in no significant adverse effects long-term.
Socioeconomics and Environmental Justice	The Proposed Project would not result in significant adverse effects to low income or minority populations.
Noise	The Project would result in temporary effects from noise during construction but would result in no significant adverse effects long-term. Short-term effects from noise would adhere to OSHA regulations.
Transportation and Traffic	The Project would result in temporary effects to traffic during construction but would result in no significant adverse cumulative effects to transportation or traffic long-term.
Electromagnetic Fields	The Project is anticipated to make a negligible contribution to cumulative effects from electromagnetic fields and interference.
Human Health and Safety	The Project would not result in significant adverse cumulative effects to human health and safety.
Reflectivity, Glare, or Dazzle	The Project would make a negligible contribution to cumulative effects from reflectivity, glare, or dazzle.

4.3 Summary of Cumulative Effects

Table 10 provides a summary of cumulative effects.

Table 10: Summary of Cumulative Effects

Environmental Resource	Past/Current Use	Proposed Action	Future Action	Cumulative Effect
General Land Use	Rural area with routinely maintained grassland. The City of Marion's storage facility.	Convert 6.62 acres of City owned land to a solar array. No Adverse Effect.	No Adverse Effect	Minor Cumulative Effects Anticipated
Important Farmland	Routinely maintained grassland – Rural Area	Convert 6.62 acres from grasses to solar array. No Adverse Effects.	No Adverse Effect	Minor Cumulative Effect Anticipated
Formally Classified Lands	City owned land.	The Project would occur within land owned by the City, all components of the Project would be	No Adverse Effect	No Cumulative Effect Anticipated

Environmental Resource	Past/Current Use	Proposed Action	Future Action	Cumulative Effect
		approved by the city council		
Floodplains	Project in FEMA delineated flood zone: Zone X, Area of Reduced Flood Risk due to Levee	The Project would not provide an increase to flood risk. The Project is located behind the Cottonwood Levee – a levee system designed to reduce the flood risk for the City of Marion.	No Adverse Effect – the City of Marion would continue to maintain the Cottonwood Levee system.	No Cumulative Effect Anticipated
Wetlands	A forested wetland was identified in the eastern portion of the project area along a former rail spur within the City owned land.	The forested wetland was identified in the eastern portion of the project area would be avoided by the project. The prevent encroachment during construction, appropriate BMPs would be employed to purposes exclude construction related traffic from encroaching into the wetland resulting in No Adverse Effect.	The wetland would continue to function in its pre-project condition with operations related traffic from encroaching into the wetland. Upon decommissioning of the project, encroachment barriers would be employed to avoid effects to the wetland resulting in No Adverse Effect.	Minor Cumulative Effect Anticipated
Water Resources	No known wells in the Project Area, surface water resources area outside of the Project Area, well protection area is present, and no sole source aquifer present.	Permits, BMPs implemented during construction/post construction, local permits, and mitigation measures would result in No Adverse Effect.	Post construction mitigation measures would result in No Adverse Effect.	Minor Cumulative Effect Anticipated
Coastal Resources	Coastal resources are not present within the Project Area.	No Adverse Effect	No Adverse Effect	No Cumulative Effect Anticipated
Biological Resources – General Biological Resources	Routinely maintained grassland results in no suitable habitats in the immediate vicinity. Trees surround the project vicinity.	Minor beneficial effect for establishing permanent vegetation below the 6.62-acre solar array. No Adverse Effect.	Minor beneficial effect for establishing permanent vegetation below the 6.62-acre solar array. No Adverse Effect.	Negligible Cumulative Effect Anticipated
Biological Resources – Listed Threatened and Endangered Species	Currently routinely maintained grassland with no suitable habitat for listed threatened/endangered species.	No Adverse Effect	No Adverse Effect	No Cumulative Effect Anticipated

Environmental Resource	Past/Current Use	Proposed Action	Future Action	Cumulative Effect
Biological Resources – Migratory Birds	Currently routinely maintained grassland with adjacent wooded areas that may be suitable habitat for migratory bird species.	Construction would be limited to timeframes when migratory birds are not present, otherwise, a qualified wildlife biologist would be employed to identify nest potential or presence of migratory birds. Minor beneficial effect for establishing permanent vegetation. No Adverse Effect.	No Adverse Effect	No Cumulative Effect Anticipated
Biological Resources – Bald and Golden Eagles	Currently routinely maintained grassland with no suitable habitat for bald and golden eagles.	No Adverse Effect.	No Adverse Effect	No Cumulative Effect Anticipated
Biological Resources – Invasive Species	Currently routinely maintained grassland. Some invasive species may be present in the project vicinity.	No Adverse Effect with the establishment of permanent native vegetation beneath the solar arrays combined with routine maintenance activities.	No Adverse Effect with the establishment of permanent native vegetation beneath the solar arrays combined with routine maintenance activities.	Negligible Cumulative Effect Anticipated
Historic and Cultural Resources	No historic properties or cultural resources identified within the APE.	No historic properties or cultural resources identified within the APE. No Adverse Effect.	No historic properties or cultural resources identified within the APE. No Adverse Effect.	No Cumulative Effect Anticipated
Aesthetics/Visual Resources	Currently routinely maintained grassland and the City's uses the project area for material storage.	A change in the visual character of the Assessment Area would occur with the installation of solar array. However, No Adverse Effect due to the limited height of the PV array and lack of public views or scenic areas	No Adverse Effect	No Cumulative Effect Anticipated
Air Quality	Area is outside of EPA designated Non-Attainment or Maintenance Area for Air Quality Criteria Pollutants.	The Project would result in temporary effects during construction (i.e., fugitive dust). No Adverse Effect.	Minor beneficial effects due to the implementation of a Renewable Energy Source. No Adverse Effect.	No Cumulative Effect Anticipated
Socioeconomics and Environmental Justice	No socioeconomic or environmental justice communities in the study area.	No Adverse Effect to socioeconomic or environmental justice communities. Minor	No Adverse Effect to socioeconomic or environmental justice communities. Minor	Negligible Cumulative Effect Anticipated

Environmental Resource	Past/Current Use	Proposed Action	Future Action	Cumulative Effect
		beneficial effect in providing renewable power to the community.	beneficial effect in providing renewable power to the community.	
Noise	Rural, low ambient noise.	No Adverse Effect, no change in ambient noise. Minor change to ambient noise during construction.	No Adverse Effect, no change to ambient noise.	Minor Cumulative Effect Anticipated
Transportation and Traffic	Light, rural traffic in the study area.	No Adverse Effect. No transportation features are proposed with the Project. Minor traffic increase will occur during construction.	No Adverse Effect. No transportation features are proposed with the Project.	Minor Cumulative Effect Anticipated
Human Health and Safety	Routinely maintained grassland. Pesticide and herbicide usage likely but unknown.	No Adverse Effects. Electromagnetic fields would increase slightly; however, the PV array would be placed inside a security fence to prevent unauthorized access. There are no hazardous materials concerns on the property. The Project would make a negligible contribution to reflectivity, glare, or dazzle	No Adverse Effect.	No Cumulative Effect Anticipated

5.0 SUMMARY OF MITIGATION

Table 11 summarizes the mitigation measures identified in the various resource sections of this EA.

Table 11: Mitigation for the Proposed Action

Resource	Mitigation Measure
Land Use, Important Farmlands, and Formally Classified Lands	None
Floodplains	The City of Marion requires building permits prior to construction. The City of Marion, who is also the floodplain administrator, would review the Proposed Action Alternative, and determine mitigative actions needed to alleviate any modifications (rise) to the floodplain, if required.
Wetlands	KPP Energy would prepare a SWPPP and install BMPs as required for construction activities. All BMPs would be installed prior to soil disturbing activities.

Resource	Mitigation Measure
Water Resources	KPP Energy would prepare a SWPPP and install BMPs as required for construction activities. All BMPs would be installed prior to soil disturbing activities.
Coastal Resources	None
Biological Resources	<p>Industry-accepted best management practices would be implemented to prevent birds from colliding with or being electrocuted by utility lines and poles would be adopted, as appropriate. Low reflective PV panels would be incorporated to minimize bird strikes.</p> <p>The construction and operation of the Project would comply with the Endangered Species Act, which provides for the protection of endangered and/or threatened species and critical habitat. Should any evidence of the presence of endangered and/or threatened species or their critical habitat be brought to the attention of the contractor, the contractor would immediately report this evidence to KPP Energy and a representative of the Agency. Construction shall be temporarily halted pending the notification process and further directions issued by the Agency after consultation with the USFWS.</p> <p>If possible, minor vegetation clearing would be performed outside the peak migratory bird breeding/nesting period (May 1-July 1) to avoid effects to nesting birds. If vegetation clearing activities cannot be avoided during this period, KPP Energy would conduct pre-clearance surveys of the site. If a field survey identifies one or more active bird nest, appropriate measures would be taken to avoid incidental take, including establishing an avoidance buffer until the young have fledged. If an active nest is identified that cannot be avoided, KPP Energy would consult with the Kansas Department of Wildlife and Parks and the USFWS to determine an appropriate course of action.</p> <p>If it is determined that the Proposed Action resulted in the introduction of invasive species at the Project, KPP Energy would develop an appropriate weed management plan(s) in keeping with any relevant Kansas policies to prevent invasive species from becoming established.</p>
Historic and Cultural Resources	The Cheyenne and Arapaho Tribes of Oklahoma, Osage Nation, and Wichita and Affiliated Tribes (Wichita, Keechi, Waco & Tawakonie) of Oklahoma would be notified if any inadvertent discoveries are made during project activities.
Aesthetics/Visual Resources	None
Air Quality	<p>KPP Energy would implement fugitive dust control measures, including watering, during construction of the Proposed Action Alternative, and all construction equipment would be maintained in accordance with manufacturer's instructions.</p> <p>No emissions are anticipated during operation of the Proposed Action Alternative.</p>
Socioeconomics and Environmental Justice	None
Noise	Construction-related noise effects would be mitigated as much as practical to minimize nighttime noise effects by limiting noise-generating activities to the hours between 6:00 a.m. and 6:00 p.m. depending on the time of year and taking into consideration construction-related safety considerations.
Transportation and Traffic	KPP Energy would coordinate with the City of Marion and Marion County, as needed, to ensure the existing traffic control infrastructure can support construction of the Proposed Action, and to coordinate access to the Project site to minimize traffic effects during construction.
Electromagnetic Fields and Interference	None

Resource	Mitigation Measure
Environmental Risk Management	Waste generation would be managed in accordance with Federal, State, and Local regulations. Safety at the Project would be managed by strict adherence to OSHA requirements. Procedures in an emergency response plan would include management efforts, a Hazardous Operations Manual, and Spill Control and Countermeasures (“SPCC”) plans designed to protect workers and the public from exposure to hazards.
Reflectivity, Glare, or Dazzle	Low glare PV panels would be incorporated into the site design.

6.0 COORDINATION, CONSULTATION, AND CORRESPONDENCE

6.1 State Historic Preservation Office Consultation

The Kansas Historical Society received the initial notification of the proposed Project and the final NHPA Section 106 Archaeological and Historical Reports for review and comment.

6.2 Tribal Consultation

The following Tribes received initial notification of the proposed Project and the final NHPA Section 106 Archaeological and Historical Reports for their review and comment:

- Cheyenne and Arapaho Tribes of Oklahoma,
- Osage Nation, and
- Wichita and Affiliated Tribes (Wichita, Keechi, Waco & Tawakonie) of Oklahoma
- Cherokee Nation
- United Keetoowah Band of Cherokee Indians in Oklahoma

6.3 Other Agency Consultation

The preparation of this Draft EA resulted in consultation with the following Agencies and Agency websites:

- Marion County Tax Assessor
- NRCS Web Soil Survey
- USGS Protected Lands Map
- National Wild and Scenic Rivers Map
- National Park Service Nationwide Rivers Inventory Map
- FEMA Floodplain Map
- USFWS NWI Map
- EPA NEPAassist
- EPA SSA Map
- EPA Ecoregions – Level III and Level IV
- USFWS IPaC
- National Register of Historic Places
- National Historic Landmarks
- Kansas Historical Society – State Historic Preservation Office

-
- HUD TDAT and the following Tribes:
 - Cheyenne and Arapaho Tribes of Oklahoma,
 - Osage Nation, and
 - Wichita and Affiliated Tribes (Wichita, Keechi, Waco & Tawakonie) of Oklahoma
 - EPA Green Book
 - Environmental Justice Screening and Mapping Tool
 - US Census Bureau Data
 - Coastal Zone Management Agency Map
 - Coastal Barrier Resource Systems Map
 - KDOT – Average Daily Traffic Counts
 - Federal Aviation Administration

6.4 Public Involvement

The public notice for the Draft EA will be made available in the Marion County Record for a 3-day review and 14-day comment period.

7.0 LIST OF PREPARERS

The following is a listing of RUS and consultant staff responsible for the preparation of this EA.

Rural Utilities Service Staff

- Marcus Brundage, Environmental Protection Specialist
- Greg Korosec, PhD, RPA, Cultural Resources Specialist

Kansas Power Project – KPP Energy

- Brooke Carroll, Director of Member Services
- James Ging, Director of Engineering Services
- Blair Tavenner

Priority Power, Inc.

- Rick Borry, Lead Head of Solar
- Todd Nickens, Development Manager/Owners Representative
- Nic Janek, Electrical Engineer/Developer

Topographic, Co.

- Chris Seiden, Senior Project Manager
- Austin Lindsay, Project Manager
- Alliah Hardin, Environmental Associate
- Kadin McBee, Environmental Associate
- Jason Voight, Quality Assurance/Quality Control

Alpine Archaeological Consultants, Inc.

- Charles Reed, Principal Investigator
- Jacki Mullen, Quality Assurance/Quality Control
