September 9, 2011

SUBJECT: Finding of No Significant Impact (FONSI)
Chemtex Project Alpha
Turkey, North Carolina

DESCRIPTION OF ACTION

The U.S. Department of Agriculture, Rural Business-Cooperative Service (RBS) has received an application from a lender, BB&T, on behalf of Chemtex International LLC for funding under the RBS 9003 Biorefinery Assistance Program. The proposed funding is for construction and operation of a refinery to produce advanced biofuels in Sampson County, North Carolina. The applicant proposes to build a facility to process hybrid perennial grasses which will be grown in near-by marginal agricultural areas presently used for disposal of swine wastes, to produce some 20 million gallons of ethanol from integrated operations; the production of which would help meet the national goal for renewable fuel standard production of 36 billion gallons of renewable fuels by 2022 established by the Energy Independence and Security Act of 2007.

The environmental analysis of this proposed action is contained in an Environmental Assessment (EA) prepared by RBS.

Chemtex proposes to site, build and operate what is called Project Alpha, on a site of 166 acres located just outside the city of Clinton, NC; the facilities would use approximately 22 acres of the site for operations and services. Production of cellulosic ethanol will use different feedstocks, primarily two hybrid grasses, Miscanthus giganteus and Arundo donax which will be developed and grown on farms presently used for growing Bermuda grasses as part of swine waste disposition. The processing technology will be a proprietary technology developed by Chemtex, called Proesa™.

This proposal, construction and operation of an advanced biofuels facility, does not pose significant adverse effects to the natural or human environment. Some mitigation measures are proposed as loan conditions, detailed below.

BASIS FOR FINDINGS

As required by the National Environmental Policy Act and agency regulations, RBS has assessed the potential environmental effects of the proposal. After consideration of the
applicant’s proposal, comments from Federal and State environmental regulatory and natural resource agencies, the agency has determined that the proposal will not have a significant adverse effect on the natural or human environment. Therefore, RBS will not prepare an Environmental Impact Statement for this proposal.

The Applicant must obtain and comply with all appropriate Federal, State, and local permits and approvals required for construction and operation of the biorefinery, and this requirement shall be incorporated and enforceable through the Agency’s Conditional Commitment for Guarantee. In addition, mitigation measures are proposed as part of loan conditions. Those measures, itemized in Table 1 attached, are for the reduction of any risk of invasive species as part of the production of feedstocks for the Project Alpha plant, and are to be incorporated into all agreements for growing feedstock using varieties of perennial grasses proposed, namely Miscanthus giganteus and Arundo donax.

**FINDINGS**

The attached environmental assessment for the subject proposal has been prepared and reviewed by the appropriate Rural Business-Cooperative Service officials. After reviewing the assessment and the supporting materials attached to it, I find that the subject proposal will not significantly affect the quality of the human environment. Therefore, the preparation of an environmental impact statement is not necessary.

I also find that the assessment properly documents the proposal’s status of compliance with the environmental laws and requirements listed therein.

<tr>
<th>Table I: Recommended Feedstock Producer Conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>The applicant, Chemtex International Inc., will incorporate into all feedstock producer agreements, the following action items, unless there is an approved Conservation Plan with NRCS:</td>
</tr>
<tr>
<td>1. New Producer orientation to discuss production methods, management activities, potential for spread of giant miscanthus and/or Arundo donax, treatment methods, and responsibilities, pest/disease identification, treatment methods, and responsibilities, eradication methods, if necessary, and reporting requirements;</td>
</tr>
<tr>
<td>2. Site-specific best management practices (BMPs), which could include, but not be limited to, NRCS Conservation Practice Standards (CPS) for soil erosion, pesticide use and application, fertilizer use and application, and other relevant areas for each specific site;</td>
</tr>
<tr>
<td>3. Setbacks/buffers to manage the giant miscanthus/Arundo donax stand and to prevent unintentional spread of the giant miscanthus/Arundo donax shall follow all local, State, or Federal regulations for containment of biomass plantings in existence at the time of the development of the producer’s Conservation Plan or through an amendment of the Conservation Plan initiated by the producer and approved by RBCS and NRCS, if determined appropriate or the site-specific conditions. If no such guidance exists, minimum procedures to prevent unintentional spread of giant miscanthus/Arundo donax shall include:</td>
</tr>
<tr>
<td>a. Establish or maintain a minimum 25 feet of setback/border around a giant miscanthus/Arundo donax stand, unless the field is adjacent to existing cropland or actively managed pasture with the same operator.</td>
</tr>
<tr>
<td>b. Setback/border areas may be planted to an annual row crop such as corn or soybeans; may be planted to a site-adapted, perennial cool-season or warm season forage or turf grass; may be kept in existing vegetation; or kept clear by disk ing, rotovating, or treating with a non-selective burn down herbicide at least once a year. The method used may be dependent on slope and the potential for erosion.</td>
</tr>
<tr>
<td>c. The use of only those known sterile varieties of giant miscanthus cultivars for producers included within the proposed project areas; all clone cultivars must be approved for planting under a recognized Quality Assurance program;</td>
</tr>
<tr>
<td>d. The initiation of a seed sampling program to determine the on-going sterility of seeds produced from the BCAP acres within the project areas. The seed sampling program includes recommended actions, including eradication, if a seed sample returns viable seed.</td>
</tr>
<tr>
<td>e. Exclusion of planting giant miscanthus on certain acreage within approximately 1,300 Feet from any known Miscanthus sinensis or Miscanthus sacchariflorus to limit the potential for cross-pollination resulting in viable seed.</td>
</tr>
</tbody>
</table>
f. Exclusion of planting giant miscanthus and/or *Arundo donax* on certain acreage within the project areas, depending upon certain site-specific conditions, like those lands subject to frequent flooding events;

<table>
<thead>
<tr>
<th>4.</th>
<th>Monitoring program developed to identify (1) spread of giant miscanthus or <em>Arundo donax</em> outside of planted fields with notification provided to both USDA and the Project Sponsors as soon as possible after identification of the issue, (2) identification of diseases and pests with notification provided to the Project Sponsors as soon as possible after identification of the issue; a USDA representative will conduct an annual field visit to monitor the site and to look for potential spread of giant miscanthus/<em>Arundo donax</em> beyond the site; the USDA will work with local weed control districts to provide additional monitoring/evaluation of these sites as appropriate.</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.</td>
<td>Annual producer reporting, which would include land use tracking with the average and total size of enrolled fields; prior land use; rationale for land use change; spread of giant miscanthus/<em>Arundo donax</em> outside of planted fields; any pests/diseases identification; the use of pesticides/herbicides to control unwanted spread of giant miscanthus/<em>Arundo donax</em> or pests/diseases; BMP and CPS incorporated into field management, such as erosion control structures or materials, vegetative barriers, etc.; fertilizer usage and application methods; and cost data.</td>

Chemtex International Inc.

Project
Alpha
Clinton, NC

September 9, 2011
I. Project Description and Need

The USDA, Rural Business-Cooperative Service (RBS) is considering an application for a loan guarantee pursuant to Section 9003 of the Food, Conservation, and Energy Act of 2008 (known as the Farm Bill of 2008). The loan guarantee is to the lender, BB&T, for ChemTex International, Inc. (the Company), to construct and operate a Cellulosic Biorefinery, known as Project Alpha, to be located southeast of Clinton, Sampson County, North Carolina. The proposal would include the construction of the biorefinery and its related infrastructure on approximately 166 acres located south of Warsaw Road (SR 24) between Fontana Street and Clive Jacobs Road (Figure 1).

The biorefinery proposes the use of local fiber crops for the production of up to 20 million gallons per year of ethanol and bio-based chemicals that will contribute to meeting the requirements of the USEPA Renewable Fuel Standard (RFS) requirements established by the Energy Independence and Security Act (EISA).

If approved, the project would commence construction in the 2nd quarter of 2012, with operations planned to begin in 2014. Simultaneous with plant construction would be the establishment of new energy crops in the nearby Sprayfield Areas, which are marginal lands that will benefit from remediation through energy crop production. There are nearly 100,000 acres of Sprayfield area lands available for growing *Miscanthus giganteus* and/or *Arundo donax*, two species of perennial grasses suitable (known as giant cane and giant reed) for biofuel production: it is estimated that approximately 15-20,000 acres of the Sprayfields Areas will be utilized for growing *Miscanthus giganteus* and/or *Arundo donax* for the initial biorefinery production of 20 million gallons/yr of ethanol; future production increases may be possible and the number of acres for *Miscanthus*/*Arundo donax* production in the Sprayfield areas would increase proportionally; however, such increases are not part of this proposed action.

Chemtex International Inc's Project Alpha will produce bioethanol and develop downstream sustainable chemicals. The project will yield the following:

- 20 million gallons per year of cellulosic ethanol and develop downstream sustainable chemicals.
- 60,000 tons of high purity chemical grade lignin.
- Create 65 direct jobs and 250 indirect jobs in an economically depressed area.
Chemtex has a proprietary process, known as Proesa™, to produce low-cost fermentable sugars from cellulosic biomass for the production of ethanol and/or bio-chemicals. The technology is unique in that it offers significant capital and operating cost benefits compared with other second generation technologies in the marketplace.

II. Primary Beneficiaries and Related Activities

The primary beneficiary of the project is the applicant, Chemtex International Inc (Chemtex). The project will also benefit the entire Sampson County area which is heavily reliant on the agricultural sector. This region is currently promoting growth in the biofuel industry. The project will create at least 65 direct jobs. There is also potential for future projects within North Carolina for additional job creation. This will have a positive economic impact on the area. Because of this project, the people in Sampson County, with possible expansion to the state of North Carolina, will benefit though indirect job creation and increased taxable assessments. To the extent that some 20 million gallons of cellulosic ethanol will be produced annually, the project will contribute to the achieving of the goals of the EISA and RFS2 standards of increased production of cellulosic and advanced biofuels which reduce dependency upon imported petroleum as well as reduce the level of green houses gas (GHG) emissions caused by the combustion of petroleum fuels.

III. Description of Project Area

The 166 acre site has been identified as NC 24 Clinton and is located south of the Turkey Highway near Clinton, Sampson County, NC. Figures 2-4 show the location of the site (Appendix A contains additional maps and photos).

Two site surveys were completed in March and April, 2011, to assess a number of parcels beyond the proposed 166 acre site. The proposed site is bounded on the north by railroad tracks and North Carolina Highway 24, beyond which are industrial businesses. The site is bounded to the east by wooded areas, beyond which are single family residential properties. The site is bounded to the south by agricultural field as well as wooded areas. The site is bounded to the west by agricultural fields. The site is bounded to the northwest by an auto salvage yard. The undeveloped woodlands consisted mainly of second and third growth loblolly pines and saplings. The surrounding landscape was generally flat. Portions of the site are heavily overgrown with greenbriers and small saplings, along with existing agricultural fields and undeveloped woodlands in the center and western side of the site. The western portion of the
The site includes hydric soils and wetlands indicators, and an unnamed tributary to Chestnut Creek and thence to the Rowan Branch stream.

Soil units for the parcels consisted of Faceville Sandy Loam, Marvyn Loamy Sand, Norfolk Loamy Sands and Rains Sandy Loam. These soil units are found predominately in agricultural settings. The upper 3 to 8 feet of these soil types consist mainly silty and or clayey sand with varying degrees of organic content underlain by sandy silty clays to an approximate depth of 99 inches. Permeability and average water storage capacity within these soil types are considered to be moderate in nature. (Appendix B contains the NRCS soils report.)

The site has a natural buffer of between 400 and 1,200 feet of woods on its east and west property lines. The site’s north property line extends for approximately 750 feet along NC Highway 24. The site’s southern boundary extends along a property that is planned for future industrial development purposes.

The site's west and north boundaries are industrial use areas that include heavy industrial zoning and light industrial zoning. Industrial activities in this area include metalworking manufacturing, a metals machining shop, metal scrap dealer, oil jobber, industrial laundry, and warehousing/distribution. The site's east boundary line of approximately 2,000 feet with between 400 and 1,200 feet of woodland buffer. This property boundary adjoins residential zoning and has about 10 residents.

The proposed site is currently zoned RA-20: Residential Agriculture. Plans are underway to submit an application to the City of Clinton Planning Board for changing this site’s zoning classification to I-2: Heavy Industrial zoning, which would fully apply to this projects uses. I-2 heavy Industrial zoning would be consistent with the City of Clinton’s zoning requirements for this project.

Figure 3

CHEMTEX SITE: TOPO
Figure 4: Regional Properties
Facilities and Processes
The plant will use a patented process technology called Proesa™, which converts selected lignocellulosic material into bio-ethanol in a sustainable manner. The production of ethanol involves four stages. The first stage is the pre-treatment of the biomass to break it into pulp at microscopic level, separating it into lignin, cellulose and hemicellulose. The second stage, known as saccharification, involves enzymatic hydrolysis of the C5 and C6 sugars.

The third stage is the fermentation process to produce ethanol from the sugars.

The final stage is the separation of ethanol via distillation. The purification involves treatment of the ethanol containing beer through resins. Lignin is separated by removing excess water through filtration. Figure 5 shows the conceptual design of the plant with its major facilities.

The plant will be a sustainable development through its use of Arundo donax (giant cane), and/or Miscanthus which have high yields on marginal and unproductive lands and reduce carbon dioxide. Lignin, produced as a by-product, will be used as a fuel for power generation on site and may also be sold for other industrial purposes, such as cosmetics.

Facilities would consist of:

- Parking Lots
- Services Building
- Offices
- Biomass Storage, Fresh and Dry
- Biomass Boiler, Geneset and Electrical
- Natural Gas Service area
- Wastewater Treatment Area
- Fermentation and Thermal Oxidation Area
- Ethanol/Enzymes Warehouse, Cooling Towers
- Rail Spur
- Entry/Access Road

IV. Environmental Impact

1. Construction

Although the project site covers 166 acres, Project Alpha will be built on approximately 22 acres (Figure 5). These 22 acres will be situated in an area to minimize impact on any wildlife or wetlands. To protect against any adverse impacts to wetlands, a minimum 50 foot vegetative buffer will be maintained around each delineated wetland and/or stream (Figure 6).

In general, all state and local construction and building code requirements will be followed. Also, state and local guidelines and regulations regarding construction practices will be observed to properly control erosion and stream siltation. Any land clearing will be reviewed with the local planning committee prior to starting work, and all local requirements will be followed.

In the construction phase, for the purpose of containing and minimizing dust emissions, there will be application of water to all areas and lanes in the building site, to wet unpaved roads and any road used by the site vehicles as well as to regularly clean vehicles leaving all process-related areas; the vehicles used for transporting dusty materials shall be covered with tarpaulins and travel at low speed.

Vehicle refueling in the building site shall take place in an ad-hoc area with waterproofed paving and suitable slopes to collect any accidental spill in the catch basins. An emergency plan shall be implemented to manage accidents that might occur in the construction stage and affect the environmental component (mainly soil and aquifer). Rainwater shall be properly managed in the building site both in the construction phase and in the operation phase.

Earth moved in the construction phase shall be stored in suitably shaped heaps so as to avoid unstable phenomena over time; such heaps of earth shall also be protected from the effects of wind and rain. Any external earth material shall be transported into the building site in compliance with regulations; in any event the Company is bound to guarantee the origin of the said material. In the case that the Company needs to dispose of the earth and rocks excavated in the construction phase, such material shall comply with the requirements set out in regulations, so as to be excluded from the waste regulations, otherwise it shall be managed as waste.

During excavations, special caution shall be taken to avoid damaging underground utilities or
structures (pipes, tanks, etc.), which might create hazardous conditions leading to contamination of the soil/subsoil. Any accidental spills of pollutants (oils, hydrocarbons, etc.) will be managed in a suitable manner, in order to avoid any soil and groundwater pollution.

In the construction phase, the Company will:

a. Segregate different types of waste;

b. Manage effluents from washrooms as liquid waste and appoint an authorized subcontractor for disposal;

c. Limit movement of pollutants;

d. Protect the ground layer vegetation, where still present in the site and will aim for rapid arrangement and restoration of green areas.

Noise levels will be controlled within allowable limits as determined by OSHA. The site will use standard engineering practices to control noise to acceptable levels (usually 80dB within 3 ft of the noise source). In addition, the Company will conduct control tests within 30 days from the start-up of the plant in order to confirm compliance with the legal limits in the neighboring residential areas. Should the levels exceed the legal limits, the plant shall be stopped until appropriate sound mitigation measures are implemented.

Landscaping activities to blend the structures in with the surrounding environment and mitigate their visual impact will be carried out before the plant is put in operation; appropriate follow up care will be taken after planting the trees, so as to promote establishment, for a period of at least 5 years, including replacing any dead trees with live ones. Landscaping will be in meet or exceed local regulations.

2. Air Quality

The Clean Air Act (CAA) required the USEPA to set National Ambient Air Quality Standards (NAAQS) for pollutants considered harmful to public health and the environment. NAAQS include two types of air quality standards. Primary standards protect public, including the health of sensitive populations such as asthmatics, children and the elderly. Secondary standards protect
public welfare, including protection against decreased visibility, damage to animals, crops, vegetation, and buildings (USEPA, 2009a). USEPA has established and North Carolina has adopted NAAQS for seven principal pollutants, which are called “criteria pollutants”.

For Project Alpha operations, there are 4 sources of projected air emissions

1. Regenerative Thermal Oxidizer (RTO)
2. Steam Generation (Boiler)
3. Waste Water Treatment system
   - this system will only generate air emissions during emergencies, which will be routed through a flare
4. Ethanol Loading
   - vapors will be taken through a flare

Areas that meet the air quality standards for the criteria pollutants are designated as being in attainment. Title 40 of the Code of Federal Regulations (CFR) Section 81.334, states that Sampson County is listed as unclassifiable/attainment for all National Ambient Air Quality Standards (NAAQS). Since Sampson County has never been designated nonattainment for any of the NAAQS, projects that are requesting federal funding or need federal approval in Sampson County would not be subject to the general conformity requirements. Therefore, a project located in Sampson County would be considered in compliance with the North Carolina Air Quality Implementation Plan (Letter from NCDENR, April, 2011).

The proposed Alpha Project is expected to be permitted as a Synthetic Minor Source with respect to New Source Review (NSR) regulations. The Alpha Project is considered under NSR as a “Fuel Conversion Plant” and would have a 100 ton/year major source threshold being applicable. The
total facility-wide emissions for the Alpha Project are expected to be well below the 100 tons/year major source permitting threshold for criteria pollutants, as shown in Table 3. The facility is not expected to be a major source of HAPs. It is expected to be classified as a HAP Area Source with total HAP emissions less than the 25 tons/year total HAP major source threshold. Additionally, any individual HAP emission is expected to be less than 10 tons/year.

The proposed biomass boiler would be subject to 40 CFR 63 Subpart J (Boiler MACT for Area Source). Based on the size of the proposed source (235 MMbtu/hr), this regulation will require it to meet the particulate limit of 0.03 lbs/MMbtu heat input. Additionally, the proposed facility’s PTE emissions are expected to demonstrate compliance with any applicable State of North Carolina and Federal ambient air quality standards (AAQS).

North Carolina has determined that facilities below the major source threshold do not pose a significant threat to air quality, and, as long as they operate in compliance with their permits, are consistent with the state implementation plan. The proposed facility would not significantly impact air quality, and the operations will be consistent with the state implementation plan. Project Alpha will have little impact on air quality standards in North Carolina and is estimated to be in compliance with the North Carolina Air Quality Implementation.

The Project will also have a net positive impact on the environment, in particular by reducing greenhouse gases and their resulting impact on global warming. With the use of Proesa technology, direct CO$_2$ emissions can be reduced by up to 91% compared to traditional gasoline. Proesa also reduces GHG emission up to 85% compared to traditional gasoline. Reductions are based on the type of feedstock used.
Odor impact

The potential for odor has been reviewed with the City and County managers, and found to be acceptable. The following BMPs will be undertaken:

a. The Company shall record on an ad hoc register the daily amounts of feedstock delivered in the storage area, the daily amount fed into the bioethanol production plant and the associated lignin output, the daily amount of lignin and possibly feedstock fed into the boiler.

b. The Company shall identify an appropriate technological solution to capture and contain odor emissions in addition to managing feedstock storage properly.

3. Water Resources

Water use may be summarized as follows:

Water inputs in the plant:

1. Water intake from City of Clinton water supply.
2. Water contained in the incoming biomass.
3. Water entering by means of the enzymatic solution and other additives in water solution.

Water outputs from the plant:

1. Evaporation from the cooling towers.
2. Discharge from the cooling towers.
3. Water leaving with the lignin flow.
6. Traces of water leaving with flows of CO$_2$, ethanol and fusel oil.

The main use of water is for topping up the cooling towers, while the production process itself does not require a great amount of topping up as a result of the considerable reuse of process waters.

Supply of water for drinking and hygienic-sanitary use will take place through connection to the City of Clinton Water supply. Wastewater will be discharged directly to the City of Clinton Waste water system.
Water will be supplied to the site by the City of Clinton. The water makeup requirement will be 1.0 MGD. The City of Clinton currently has a 12-inch water line, which serves this site. The City’s water system currently has an available surplus of 1.0 MGD with an additional 1.0 MGD available from existing wells. In addition, the City of Clinton is studying water system expansion improvements that would include the City’s water treatment capacity by 2.5 MGD.

Additionally, the City of Clinton draws water from two aquifers, the Black River aquifer (shallow) and the Cape Fear aquifer (deep). The City of Clinton expects that given proper management of the well fields, an additional 1.5 million gallons per day is available for use.

The site’s wastewater (for both process and sanitary) would be handled by the City of Clinton’s Waste Water Treatment System. The expected flow to sewer from the site will be 550,000 G/D. The City of Clinton currently has an 8-inch gravity sewer line that serves this site. The City’s wastewater treatment system currently has an available surplus of 1.5 MGD.

The sewage system for disposal of effluent waters may be broken into two separate networks for the treatment of clean water, and waste water.

Clean water may be used to feed the Fire Water Tanks, and the excess from these tanks will not be discharged to any source outside the facility. The water system will be managed through the waste water treatment located on facility. This is also true for storm water management. The clean water network may feed the fire prevention tanks and the excess from these tanks will flow through a suitable conduit into the canal outside the plant. The waste water network will be delivered to the water treatment plant in the anaerobic digestion section.

There will be a waste water treatment facility located on site to clean and reuse most water. The WWT facility will consist of large anaerobic reactors to remove the bulk of the organic load from the wastewater with a flowrate of 1.5 MGD. The reactors can produce effluent with COD/ BOD/ TSS concentrations as low as 9000, 3000, and 1000 mg/l respectively, as well as a significant quantity of biogas (for on-site power use), and waste biological solids. The anaerobic reactor effluent will be polished in an aerobic system. A portion of that effluent will then be sent to the City of Clinton as effluent while the remainder will be further polished in a Reverse Osmosis system before being returned to the process.
The makeup of the water discharge, in particular the process water discharge, and been reviewed with City of Clinton and their engineering consultants and found to be acceptable. It is anticipated that flows to the city will have the following characteristics:

1. COD < 700 mg/l
2. BOD < 10 mg/l
3. TSS < 10 mg/l
4. Temperature < 35°C
5. pH 7.0 – 8.5

Due to the strict requirements of the Fermentation process and Boiler feedwater makeup, treated, or ‘gray’, water is not a feasible option. Chemtex is reviewing the water usage plan to minimize water makeup through process changes and in-house waste water treatment optimization.

The Waste Water Treatment system will be sized to also handle cleanup water, which might be contaminated with grease or oil.

Chemtex’s Proesa™ process requires a considerable amount of water, particularly in the phases of pre-hydrolysis and enzymatic hydrolysis. Water is also used in gas washing operations, in the scrubber that cleans the exhaust steam and in the scrubber that cleans the CO₂ deriving from fermentation. A certain amount of water is also needed to top-up the water in the cooling circuit and to feed the de-mineralized water plant producing water for steam production.

The overall facility design process is to recover and recycle after a specific treatment a large part of the water exiting from the process. All these flows pass through a water treatment plant in order to reduce COD and eliminate inhibitors and other molecules that might be harmful if recycled in the process.

**Wetlands/Streams**

There is water body associated with hydric soils which transects the western portion of the site as an unnamed tributary of Rowan Branch, flows south to Chestnut Pond and into Rowan Branch. Along the unnamed tributary, a large ponded area was observed in the southeastern corner of Parcel B and two ponds were observed along the western property boundary of Parcel F.

Utilizing the USACE wetland delineation methodology with regard to the NCDENR definition of a wetland, there are approximately 20-35 acres of wetlands which may be jurisdictional under Federal law. Their relative sizes and locations are depicted on Figures 6 through 7. No wetlands
were encountered within the rest of the project site. To prevent impacts to wetlands, no construction activities, including vegetation removal, material dredge, or fill will take place within any wetland areas, nor within 50 ft of any delineated wetland area or stream. Facilities, including utility services, roads, and railroad spur have been sited so that no operations will impact wetland areas.

4. Solid Waste

Waste disposal is a service offered by the City of Clinton. They provide curbside service through Clinton Waste Management Services. Also, a landfill is located in Sampson County. Sampson County hosts a regional landfill that exceeds federal Subtitle D and state solid waste requirements. The landfill is owned and operated by Sampson County Disposal, Inc., a subsidiary of Waste Industries, Inc. The landfill is located approximately 8 miles west of Clinton and 4 miles east of Roseboro on Highway 24. The landfill will accept construction debris, demolition debris, commercial yard waste, business and residential waste, and has sufficient capacity for the foreseeable future to handle all of the estimated facility’s wastes. In the construction phase, debris will only be during the 18-month construction timeframe. It will be the responsibility of the General Contractor to remove construction debris from the site, to be land filled appropriately. The Company will: segregate different types of waste, manage effluents from washrooms as liquid waste and appoint an authorized subcontractor for disposal, limit movement of pollutants, protect the ground layer vegetation, where still present in the site, rapid arrangement and restoration of green areas. Compliance must be ensured with the state and local provisions as with the relevant industry standards applying in the various fields considered.

During operations the following wastes will be generated:

- Solid waste will be generated from the Waste Water treatment plant, 115 yd3 @ 20% solids. This material will not be hazardous; it is planned that this material will be land applied to provide nutrients and moisture to agricultural land, not land filled.

- The Steam Generation system will also produce solid waste in the form of ash, approximately 1,999 tons/year. The ash is not hazardous and will be disposed on in the county landfill, where there is sufficient capacity for this amount.

- A nominal amount of solid waste will be generated from the biomass handling system as sweepings.
Items or equipment removed from service (such as bag filters, filter elements, screens, etc) will be minimal as equipment/parts are expected to have minimum 2-year life. Parts will be sent to the landfill as needed.

There are not expected to be any hazardous solid wastes, as the Proesa™ process uses steam and heat separate the sugars, not chemicals as in some other processes. Project Alpha will not treat, store, or dispose of hazardous wastes at the facility.

Sufficient capacity for land filling such materials exists nearby in Sampson County.

At the facility, feedstock will be stored in a roofed area with paving suitable for collecting any drippings in the collection system.

Lignin, a byproduct of the Ethanol process, will be stored exclusively in a dedicated area; if transportation to and from storage is done via a conveyor belt, it will be adequately protected from weather conditions and to prevent odor emissions.

Chemicals and in general of substances that are potentially hazardous for the environment shall be stored in appropriate tanks equipped with a suitably-shaped containment basin for collecting any accidental spill. Any spill caused by the leakage or breakage of the tanks containing chemicals (anti-foam agents, enzymatic solution and urea) required for production purposes shall be disposed of as liquid waste and shall not be routed to the effluent treatment unit.

The fusel oil (alcohols) resulting from the distillation process for the production of bioethanol shall not be used to feed the lignin-combustion boiler for power generation purposes and shall be routed to the wastewater treatment unit by means of a dedicated pipe, taking care to avoid any accidental spill. The Company shall supply a chemical analysis of the effluent originating from the treatment unit to confirm that the routing of fusel oil into the treatment unit does not cause any modification in re-circulating water that might affect the composition of air emissions already reported.

5. Permits

Appendix C contains a list of potential permits required. From current projections, it appears that the Company would be in compliance with all applicable permits.
6. Land Use

The land use will require zoning changes from residential and agricultural to industrial for the site. The effect of changing the project site land use will be a positive one for several reasons. By using feedstock not suitable for human or animal consumption, and which will be grown on marginal lands, providing soil remediation, there will be a positive impact on area resources. Furthermore, the project brings a unique advanced technology to the area that provides significant energy-security advantages by producing renewable fuel from local sources. Another benefit of the project on the land is that the project proposes to use selected high-yield crops (Arundo donax, Miscanthus), which can yield in the 10-20 dry ton per acre. This agricultural model can provide substantial added-value for the local farmers and integrators that are presently farming low yield biomasses like coastal Bermuda grass (1-4 dry tons per acre depending from the year). The energy grasses selected will not only be the feedstock supporting the plant, but will provide substantial benefits to the land with higher potential for nutrients uptake allowing a natural integration with the existing swine and poultry operations in the area.

7. Transportation

The project will be located within an industrially developed area of the City of Clinton, approximately 3- miles from the city center. The project site fronts on NC-24, which is planned to be by-passed with the rerouting of NC-24 east through a corridor located south of this site area. This rerouting of NC-24 will alleviate the volume of east and westbound truck and car traffic on the current NC-24. Currently, some 8,700 trucks/day use NC-24 in the vicinity of the project area.

The project will increase transportation at and near the project site as there is truck traffic scheduled for 10 trucks per hour, 12 hours a day and 7 days a week. The proposed site is located within an area of existing heavy industrial activity and therefore can accommodate this site’s development plans. There are a small number of residents (less than 10) to the sites east property line and with a minimum buffer of 400 to 500 feet; there would be minimal impact to residential properties.

The site is adjacent to Turkey Highway on North Carolina Highway 24, which allows for direct
access to a major road. Additionally, several other major highways including Highway 403 and 701 are in the immediate vicinity. Interstate 40 is approximately 14 miles from the site and Interstate 95 is approximately 30 miles from the site.

The site is located on a major rail service line. There are also multiple lines of service available in the town of Clinton, the municipality where the site is located. Rail access will be extended to the site for use in transporting the ethanol product. The Company will provide adequate guarantees that transportation of bioethanol by rail will be conducted in a suitable manner to minimize risks for the population exposed.

An inquiry with NC Department of Transportation local District Engineering Office provide the following options for developing this site with the above-stated truck traffic.

1. Install the driveway access on the eastern side of the property to avoid conflict with the existing four lane section and construct a left turn lane and right turn lane, both with 150’ minimum storage and 150’ bay tapers.

2. Install the driveway access closer to the western side of the property and extend the existing four lane section down past the site and strip the inside west bound lane for a dedicated left into the development and strip the outside east bound lane for the right turn lane into the development.

The right of way in that section of NC 24 is 30 feet from the centerline on the north side and 30 feet from the centerline on the south side and/or to the center of the ditch between the railroad and NC 24.

8. Natural Environment

This project will not negatively affect the natural environment of the site location. There are no known effects to the natural environment or the wildlife at this time. The area is not listed on the National Registry of Natural Landmarks, nor located near any designed National Park, Wildlife Refuge or State Parks.
9. SocioEconomics/Environmental Justice

The project will create an additional 65 direct jobs and 250 indirect jobs in North Carolina (based on Bureau of Economic Analysis 3.8 jobs are created per every 1 biorefinery job). The majority of these jobs will be sourced from locally available resources. In terms of potential economic impact for North Carolina, this complex will be the first of its kind in North America and will provide the foundation for further expansion and development of related industries.

Executive Order 12898 of February 11, 1994, *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations*, requires federal agencies to consider whether their projects would result in disproportionate adverse impacts on minority or low-income populations in the United States, its territories and possessions, the District of Columbia, the Commonwealth of Puerto Rico, and the Commonwealth of the Mariana Islands (U.S. Department of Housing and Urban Development, 1994).

The population of Sampson County in 2010 was 63,431 persons, an increase of approximately 5% since 2000. The percentages of minority groups in Sampson County are: 27%- Black; 16%- Hispanic; 2%- Native American; 2%- two races reported. The percentage of persons in poverty is approximately 21%. Median household income in 2009 was $33,937; per capita income was $18,295.

The U.S. Census Bureau defines poverty areas as census tracts or block numbering areas where at least 20 percent of the residents are below the poverty level, which is determined using a set of monetary income thresholds that vary by family size and composition that do not vary geographically but are updated for inflation (U.S. Census Bureau, 2010d, and Appendix C).

There would be no disproportionate adverse impacts to any population group from the construction of the Alpha Project. Implementation of the action will likely have a positive impact on the local economy, both during the construction phase and during the operational phase of the facility. Local vendors and construction contractors would likely benefit from potential work opportunities associated with the construction of the facility.
10. **Energy Impacts**

Project Alpha’s proposed site is located approximately 2,100 feet south of a Progress Energy 115/138 KV electric transmission line, which will more than adequately serve this project’s electric requirements.

Project Alpha’s proposed site is serviced by a 4-inch natural gas line of the Piedmont Natural Gas Company, which is located along sites frontage on NC-24. Discussions are underway with Piedmont Natural Gas Co. to determine if this gas line will adequately serve this project’s needs or if a new service line will need to be installed to provide adequate gas supplies for this project.

In general terms, this project will not impact the area’s energy supplies.

**Steam:**

Steam is produced on the site with the non-fermentable residues of the biomass (lignin). The lignin will be consumed in a biomass boiler, which will generate steam for the process.

**Power:**

Some power will be produced on the site by use of biogas (a byproduct from the anaerobic waste water treatment system). The biogas will generate power via a generator, providing approximately 4.4 MW. Additional power will be taken from the local electrical grid.

The machines with the highest power consumption are the process pumps and the systems for handling solids.

**Natural gas:**

Natural gas is used in the plant as a fuel to feed:
1. Pilot lights for biomass boilers (only during switch-on phases)
2. Thermal oxidizer (only when the oxidizer load is insufficient to sustain spontaneous combustion reactions)

In the biomass boiler, natural gas feeds the pilot lights during switch-on to sustain combustion, while in the thermal oxidizer it is required to sustain the oxidizing reactions in the case of a decline in the amount of pollutant entering the oxidizer (this is normally sufficient to maintain
The amount of natural gas taken from the network is reduced by using biogas, produced during the anaerobic digestion phase of the water treatment plant, as fuel for the boilers.

**Energy savings:**

In order to reduce energy consumption (essentially power and natural gas) the facility design has achieved results by:

1. Choice of cutting edge high-efficiency equipment and systems;
2. Optimal heat recovery in the ethanol production plant;
3. Optimal thermal recovery in the auxiliary utilities production systems.

In particular, the following improvements were introduced:

1. Recovery of exhaust steam from steam explosion to provide necessary energy for the beer stripper and other minor utilities: enables a reduction in steam consumption by the plant and therefore in gas consumption by the boilers; 92% of pretreatment exhaust steam is recovered;
2. Introduction of an aerobic section in the water treatment plant: enables a reduction in the amount of natural gas taken from the external network;
3. Use of high-efficiency boilers: enables maximum steam production in relation to the amount of fuel burnt;
4. Use of high-efficiency engines and electronic switch-on and regulation units for large engines: these plant devices enable reduced energy consumption by engines in relation to their mechanical performance.
5. Use of a high-efficiency lighting system: enables a notable reduction in electricity consumption.

**Natural Gas**

Piedmont Natural Gas Company is the natural gas provider for the site. An existing 4inch natural gas line is located on the north side of the site’s frontage on NC-24 and will provide adequate natural gas for the process requirements.

**Electrical Service**

The local power provider is Progress Energy; with an existing 115/138KV transmission line
located approximately 2,000ft north of the site. Progress Energy has surveyed the project site and determined it is feasible to bring power onto the site from the existing transmission line.

11. Aesthetics

The plant will be located in a rural area, in the center of hundreds of acres. Wastes brought on-site will be sorted within a building and processed in enclosed pieces of equipment such as tanks. No piles of materials will be visible. No aesthetics issues associated with the proposed project are anticipated.

V. Coastal Zone Management Act

The area is not considered part of the Coastal Zone Management Program.

VI. Compliance With Advisory Council on Historic Preservation's Regulations

There are no properties listed on the National Register of Historic Places on or near the Project Alpha site. In addition, no historic properties which might be eligible for listing on the National Register are on or near the Project Alpha site. Appendix D includes correspondence with State Historic Preservation Officer, who concurred in the determination of no historic properties affected by the proposed facility.

VII. Compliance With the Wild and Scenic Rivers Act

The site is not within nor will affect any designated portion of a wild and scenic river.

VIII. Compliance With the Endangered Species Act

A site survey was performed to determine if there were any listed or candidate species and the survey found no evidence of any species covered under the Endangered Species Act. Consultation with the US Fish and Wildlife Service (USFWS) resulted in a determination that no threatened or endangered species would be affected by the Project Alpha construction and operation, as shown in Appendix D.

IX. Compliance With Farmland Protection Policy Act and Departmental Regulation 9500–3, Land Use Policy

A site-specific soils report is in Appendix B. Appendix D provides a copy of the form AD-1006, to determine impacts to prime farmland. The results show the conversion of some 22 acres prime farmland within the project area; scores low, and is considered a minor adverse impact.
X. Compliance With Executive Order 11988, Floodplain Management, and Executive Order 11990, Protection of Wetlands

There are wetlands on the western side of the site, as shown in Figures 4 and 5, in association with the unnamed tributary to Rowan Creek. The applicant will avoid impacting all such wetlands during construction and operation by siting all facilities and services more than 50 ft from them; in those instances where the road might cross a wetland area, the applicant will obtain all Section 404 permits from the Army Corps of Engineers.

The unnamed tributary to Rowan Creek is designated on the FEMA FIRM map as within the 100 yr Flood zone, designated as a Special Flood Hazard Area (SFHA, as shown in Appendix E). No facilities or services will be constructed within that SFHA, and no activities will fill, dredge, alter or otherwise adversely affect the SFHA area.

XI. Compliance With Coastal Barrier Resources Act

The project is not located within the Coastal Barrier Resources System.

XIII. Consultation Requirements of Executive Order 12372, Intergovernmental Review of Federal Programs

A project description was sent to NC State agencies, as well as Federal agencies and their responses are in Appendix F. Commentors noted that the City of Clinton would need to make a determination of water supply adequacy under State law, if providing water for Project Alpha which will be done. Commentors also recommended additional information on the use of potentially invasive species for the feedstock in the Sprayfield areas. The cumulative impacts section below addresses the issue of invasive species in the Sprayfield areas and proposes mitigation measures to reduce any risks to the environment from potential spreading outside the Sprayfield areas.

XV. Reaction to Project

A Public Notice for the project was published in the local paper (the Sampson Independent) from July 19-21, 2011. No negative comments were received from the public, some 5 comments were in favor of the project. In addition, letters describing the project were sent to all adjacent landowners. Consultation and notice were frequent with city of Clinton officials and Sampson County officials. A copy of the Incentive Letter provided by Sampson County as voted on by the Sampson County Commissioners in Public Hearing is also provided in Appendix G. Overall public reaction has been in favor of the project.
XVI. Cumulative Impacts

Feedstock from the Sprayfield Areas

Project Alpha proposes to obtain feedstock from a three county area within a 50 km radius of the plant. The targeted growers would be those within what is known as The Sprayfields Area, which is used for the disposal of swine manure by spray application to Bermuda grass fields subsequently harvested for hay. There are some 100,000 acres currently being used for swine manure disposal within the three county region of Duplin, Wayne, and Sampson (Figure 8); the proposed project would enter into contractual agreements for the use of approximately 15-25,000 acres within the three county area for the growth of selected biofuel feedstock with the intention to use higher yielding varieties of perennial grasses as feedstock, such as *Miscanthus giganteus*, and *Arun donax* (giant cane), both of which would have yields more than four times that of bermuda grass, and could be harvested year round, using existing or slightly modified farm equipment. The process used is illustrated in Figure 8 (and detailed in Appendix H). The feedstock would first be established on a plantation for distribution by rhizome or vegetative stem. Neither grasses produce seed but spread from vegetative or rhizome cultivation.
Figure 8-a2: Swine Lagoons in Eastern NC
Figure 9: Arundo donax before fall harvesting
Figure 10: Planting Operations
FIGURE 11: Initial Planting Process
Various methods can be used to plant Miscanthus and Arundo donax, and additional research is underway in North Carolina on the optimal method for planting. Subsequent to the planting, the plantations would grow the grasses for a year before harvesting would commence. Once established, the varieties need no herbicide or nutrient application, and harvesting could be seasonal, or year round, depending upon the variety grown, and the delivery terms of each contract, as shown in Figure 13.
### Figure 13: Supply Chain Model

- Fresh, chopped material will be used 80% of the year, and dried, baled material will be used 20% of the year.

- The chopped material, due to the light bulk density and water content making transportation cost higher than baled material, will generally be taken from farms within 35-miles of the facility. This material will be harvested year-round. Both Arun donax and Miscanthus are good candidates for chopped material.

- The baled material will be kept at the field, under plastic, until it is required at the facility. It is economically feasible to bring baled material from within 50-miles of the facility. Testing at the Chemtex pilot facility has shown little change in product yield for baled material stored for long periods of time (such as 1-year). Miscanthus, bermuda grass, and wheat straw are good candidates for baled material.

- Feedstock will be brought to the facility via truck 7-days/week.

- There will be 3-days of on-site storage, kept in an open sided building w/ roof. The building will have ventilation and fire prevention systems.

- The chopped material will be processed within 72-hours of harvesting; after this time the degraded material is not suitable.
Currently, the Sprayfields use lagoons for swine manure storage, and use spray application of the nutrient-laden water for growing Bermuda grass which is harvested for hay. The use of energy grasses in place of Bermuda grass will benefit the sprayfield land managers because the higher yielding energy grass will remediate more nutrients; the energy grasses will be sold as feedstock for the facility; and the change will convert marginal land into productive land. It is anticipated that switching to energy cane grasses would not require additional water or nutrients, and that no adverse impacts to soils, water quality or land use would result. Possible beneficial impacts to soils, water quality and land use would be minor to moderate, depending upon the type of grasses, the length of growing and harvesting management actions.

Invasive Species Concerns

*Arundo donax* and *Miscanthus giganteus* are not listed as an invasive species within North Carolina. Neither species reproduces by seed. However, other varieties of Miscanthus such as *Miscanthus sinensis* or *Miscanthus sacchariflorus* are considered invasive species; in other States, such as Tennessee, Texas, and California, *Arundo donax* has been considered an invasive species ([http://plants.usda.gov/java/profile?symbol=ARDO4&mapType=nativity&photoID=ardo4_005_avp.jpg](http://plants.usda.gov/java/profile?symbol=ARDO4&mapType=nativity&photoID=ardo4_005_avp.jpg)). Concerns have been raised about the potential for unwanted spreading of rhizomes to other fields or to water bodies with potential downstream establishment, particularly in wetlands. To reduce the potential for any unwanted propagation, best management practices will be required for all producer feedstock agreements to include mandatory consultation by producers with local NRCS agents, and adoption of specific NRCS BMPs to include the provisions of Table 4:
The applicant, Chemtex International Inc., will incorporate into all feedstock producer agreements, the following action items, unless there is an approved Conservation Plan with NRCS:

1. New Producer orientation to discuss production methods, management activities, potential for spread of giant miscanthus and/or Arundo donax, treatment methods, and responsibilities, pest/disease identification, treatment methods, and responsibilities, eradication methods, if necessary, and reporting requirements;

2. Site-specific best management practices (BMPs), which could include, but not be limited to, NRCS Conservation Practice Standards (CPS) for soil erosion, pesticide use and application, fertilizer use and application, and other relevant areas for each specific site;

3. Setbacks/buffers to manage the giant miscanthus/Arundo donax stand and to prevent unintentional spread of the giant miscanthus/Arundo donax shall follow all local, State, or Federal regulations for containment of biomass plantings in existence at the time of the development of the producer’s Conservation Plan or through an amendment of the Conservation Plan initiated by the producer and approved by RBCS and NRCS, if determined appropriate or the site-specific conditions. If no such guidance exists, minimum procedures to prevent unintentional spread of giant miscanthus/Arundo donax shall include:
   a. Establish or maintain a minimum 25 feet of setback/border around a giant miscanthus/Arundo donax stand, unless the field is adjacent to existing cropland or actively managed pasture with the same operator.
   b. Setback/border areas may be planted to an annual row crop such as corn or soybeans; may be planted to a site-adapted, perennial cool-season or warm season forage or turf grass; may be kept in existing vegetation; or kept clear by disking, rotovating, or treating with a non-selective burn down herbicide at least once a year. The method used may be dependent on slope and the potential for erosion.
   c. The use of only those known sterile varieties of giant miscanthus cultivars for producers included within the proposed project areas; all clone cultivars must be approved for planting under a recognized Quality Assurance program;
   d. The initiation of a seed sampling program to determine the on-going sterility of seeds produced from the BCAP acres within the project areas. The seed sampling program includes recommended actions, including eradication, if a seed sample returns viable seed.
   e. Exclusion of planting giant miscanthus on certain acreage within approximately 1,300 Feet from any known Miscanthus sinensis or Miscanthus sacchariflorus to limit the potential for cross-pollination resulting in viable seed.
f. Exclusion of planting giant miscanthus and/or *Arundo donax* on certain acreage within the project areas, depending upon certain site-specific conditions, like those lands subject to frequent flooding events;

4. Monitoring program developed to identify (1) spread of giant miscanthus or *Arundo donax* outside of planted fields with notification provided to both USDA and the Project Sponsors as soon as possible after identification of the issue, (2) identification of diseases and pests with notification provided to the Project Sponsors as soon as possible after identification of the issue; a USDA representative will conduct an annual field visit to monitor the site and to look for potential spread of giant miscanthus/Arundo donax beyond the site; the USDA will work with local weed control districts to provide additional monitoring/evaluation of these sites as appropriate.

5. Annual producer reporting, which would include land use tracking with the average and total size of enrolled fields; prior land use; rationale for land use change; spread of giant miscanthus/Arundo donax outside of planted fields; any pests/diseases identification; the use of pesticides/herbicides to control unwanted spread of giant miscanthus/Arundo donax or pests/diseases; BMP and CPS incorporated into field management, such as erosion control structures or materials, vegetative barriers, etc.; fertilizer usage and application methods; and cost data.

**XIX. Mitigation Measures**

To ensure that there are no impacts to the natural environment from the spread of potentially invasive species of Miscanthus and/or Arundo donax, RBS will condition the loan guarantee to include recommended consultation with NRCS and minimum BMPs listed in Table 4 above as part of all producer agreements for growing feedstock using Miscanthus and/or Arundox donax.
XX. Environmental Determinations

The following recommendations shall be completed:

A. Based on an examination and review of the foregoing information and such supplemental information attached hereto, I recommend that the approving official determine that this proposal will have: ( ) a significant effect on the quality of the human environment and an Environmental Impact Statement must be prepared; will not have (X) a significant effect on the quality of the human environment.

B. I recommend that the approving official make the following compliance determinations for the below-listed environmental requirements.

C. I have reviewed and considered the types and degrees of adverse environmental impacts identified by this assessment. I have also analyzed the proposal for its consistency with FmHA or its successor agency under Public Law 103–354 environmental policies, particularly those related to important farmland protection, and have considered the potential benefits of the proposal. Based upon a consideration and balancing of these factors, I recommend from an environmental standpoint that the proposal

___ be approved.  
___ not be approved because of the attached reasons.

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://soils.usda.gov/sqi/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (http://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://soils.usda.gov/contact/state_offices/).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Soil Data Mart Web site or the NRCS Web Soil Survey. The Soil Data Mart is the data storage site for the official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means of communication should contact USDA’s TARGET center at 1-800-877-8339 (voice) or 1-800-845-6136 (TDD) or the Federal Relay Service at 1-800-877-8339 (voice).
for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil scientists classified and named the soils in the survey area, they compared the
individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.
Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

**MAP INFORMATION**

Map Scale: 1:8,350 if printed on A size (8.5" × 11") sheet.

The soil surveys that comprise your AOI were mapped at 1:24,000.

Please rely on the bar scale on each map sheet for accurate map measurements.

Source of Map: Natural Resources Conservation Service

Coordinate System: UTM Zone 17N NAD83

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Sampson County, North Carolina

Survey Area Data: Version 11, Jun 5, 2009

Date(s) aerial images were photographed: 6/22/2006

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Descriptions (Project Alpha - 166.4 acres)

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the...
contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a soil series. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into soil phases. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A complex consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An association is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An undifferentiated group is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include miscellaneous areas. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.
Sampson County, North Carolina

BH—Bibb and Johnston soils, frequently flooded

Map Unit Setting

*Elevation:* 80 to 330 feet
*Mean annual precipitation:* 38 to 55 inches
*Mean annual air temperature:* 59 to 70 degrees F
*Frost-free period:* 210 to 265 days

Map Unit Composition

*Bibb, undrained, and similar soils:* 80 percent
*Johnston, undrained, and similar soils:* 10 percent

Description of Bibb, Undrained

Setting

*Landform:* Flood plains
*Landform position (two-dimensional):* Toeslope
*Down-slope shape:* Concave
*Across-slope shape:* Linear
*Parent material:* Sandy and loamy alluvium

Properties and qualities

*Slope:* 0 to 2 percent
*Depth to restrictive feature:* More than 80 inches
*Drainage class:* Poorly drained
*Capacity of the most limiting layer to transmit water (Ksat):* High (1.98 to 5.95 in/hr)
*Depth to water table:* About 0 to 12 inches
*Frequency of flooding:* Frequent
*Frequency of ponding:* None
*Available water capacity:* Moderate (about 7.2 inches)

Interpretive groups

*Land capability (nonirrigated):* 5w

Typical profile

0 to 6 inches: Sandy loam
6 to 60 inches: Sandy loam
60 to 80 inches: Loamy sand

Description of Johnston, Undrained

Setting

*Landform:* Flood plains
*Down-slope shape:* Concave
*Across-slope shape:* Linear
*Parent material:* Sandy and loamy alluvium

Properties and qualities

*Slope:* 0 to 2 percent
*Depth to restrictive feature:* More than 80 inches
*Drainage class:* Very poorly drained
*Capacity of the most limiting layer to transmit water (Ksat):* High (1.98 to 5.95 in/hr)
*Depth to water table:* About 0 inches
*Frequency of flooding:* Frequent
Frequency of ponding: Frequent
Available water capacity: High (about 9.4 inches)

Interpretive groups
Land capability (nonirrigated): 7w

Typical profile
0 to 30 inches: Mucky loam
30 to 34 inches: Loamy fine sand
34 to 80 inches: Fine sandy loam

FaA—Faceville fine sandy loam, 0 to 2 percent slopes

Map Unit Setting
Elevation: 80 to 330 feet
Mean annual precipitation: 38 to 55 inches
Mean annual air temperature: 59 to 70 degrees F
Frost-free period: 210 to 265 days

Map Unit Composition
Faceville and similar soils: 90 percent

Description of Faceville

Setting
Landform: Flats on marine terraces, ridges on marine terraces
Down-slope shape: Convex
Across-slope shape: Convex
Parent material: Clayey marine deposits

Properties and qualities
Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high
(0.57 to 1.98 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Moderate (about 8.1 inches)

Interpretive groups
Land capability (nonirrigated): 1

Typical profile
0 to 8 inches: Fine sandy loam
8 to 13 inches: Fine sandy loam
13 to 80 inches: Clay
FaB—Faceville fine sandy loam, 2 to 6 percent slopes

Map Unit Setting
- Elevation: 80 to 330 feet
- Mean annual precipitation: 38 to 55 inches
- Mean annual air temperature: 59 to 70 degrees F
- Frost-free period: 210 to 265 days

Map Unit Composition
- Faceville and similar soils: 85 percent

Description of Faceville

Setting
- Landform: Ridges on marine terraces
- Landform position (two-dimensional): Shoulder, summit
- Landform position (three-dimensional): Crest
- Down-slope shape: Convex
- Across-slope shape: Convex
- Parent material: Clayey marine deposits

Properties and qualities
- Slope: 2 to 6 percent
- Depth to restrictive feature: More than 80 inches
- Drainage class: Well drained
- Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 1.98 in/hr)
- Depth to water table: More than 80 inches
- Frequency of flooding: None
- Frequency of ponding: None
- Available water capacity: Moderate (about 8.1 inches)

Interpretive groups
- Land capability (nonirrigated): 2e

Typical profile
- 0 to 8 inches: Fine sandy loam
- 8 to 13 inches: Fine sandy loam
- 13 to 80 inches: Clay

GoA—Goldsboro loamy sand, 0 to 2 percent slopes

Map Unit Setting
- Elevation: 80 to 330 feet
- Mean annual precipitation: 38 to 55 inches
- Mean annual air temperature: 59 to 70 degrees F
- Frost-free period: 210 to 265 days
Map Unit Composition

Goldsboro and similar soils: 90 percent
Minor components: 5 percent

Description of Goldsboro

Setting

Landform: Flats on marine terraces, broad interstream divides on marine terraces
Landform position (two-dimensional): Summit
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Loamy marine deposits

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Moderately well drained
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high
(0.57 to 1.98 in/hr)
Depth to water table: About 24 to 36 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Moderate (about 8.0 inches)

Interpretive groups

Land capability (nonirrigated): 2w

Typical profile

0 to 8 inches: Loamy sand
8 to 15 inches: Loamy sand
15 to 45 inches: Sandy clay loam
45 to 80 inches: Sandy clay loam

Minor Components

Rains, undrained

Percent of map unit: 5 percent
Landform: Flats on marine terraces, carolina bays on marine terraces, broad interstream divides on marine terraces
Landform position (two-dimensional): Summit
Down-slope shape: Linear
Across-slope shape: Linear

Ln—Lynchburg sandy loam

Map Unit Setting

Elevation: 80 to 330 feet
Mean annual precipitation: 38 to 55 inches
Mean annual air temperature: 59 to 70 degrees F
Frost-free period: 210 to 265 days
Map Unit Composition

Lynchburg and similar soils: 85 percent
Minor components: 7 percent

Description of Lynchburg

Setting

Landform: Flats on marine terraces, broad interstream divides on marine terraces
Landform position (two-dimensional): Summit
Down-slope shape: Concave
Across-slope shape: Linear
Parent material: Loamy marine deposits

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Somewhat poorly drained
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high
(0.20 to 1.98 in/hr)
Depth to water table: About 6 to 18 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Moderate (about 7.3 inches)

Interpretive groups

Land capability (nonirrigated): 2w

Typical profile

0 to 6 inches: Sandy loam
6 to 10 inches: Sandy loam
10 to 65 inches: Sandy clay loam
65 to 80 inches: Clay

Minor Components

Rains, undrained

Soil Information for All Uses

Suitabilities and Limitations for Use

The Suitabilities and Limitations for Use section includes various soil interpretations displayed as thematic maps with a summary table for the soil map units in the selected area of interest. A single value or rating for each map unit is generated by aggregating the interpretive ratings of individual map unit components. This aggregation process is defined for each interpretation.

Land Classifications

Land Classifications are specified land use and management groupings that are assigned to soil areas because combinations of soil have similar behavior for specified practices. Most are based on soil properties and other factors that directly influence the specific use of the soil. Example classifications include ecological site classification, farmland classification, irrigated and nonirrigated land capability classification, and hydric rating.

Farmland Classification (Project Alpha - 166.4 acres)

Farmland classification identifies map units as prime farmland, farmland of statewide importance, farmland of local importance, or unique farmland. It identifies the location and extent of the soils that are best suited to food, feed, fiber, forage, and oilseed crops. NRCS policy and procedures on prime and unique farmlands are published in the "Federal Register," Vol. 43, No. 21, January 31, 1978.

**MAP INFORMATION**

Map Scale: 1:8,350 if printed on A size (8.5" × 11") sheet.

The soil surveys that comprise your AOI were mapped at 1:24,000.

Please rely on the bar scale on each map sheet for accurate map measurements.

Source of Map: Natural Resources Conservation Service
Coordinate System: UTM Zone 17N NAD83

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Sampson County, North Carolina
Survey Area Data: Version 11, Jun 5, 2009

Date(s) aerial images were photographed: 6/22/2006

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydric Rating by Map Unit (Project Alpha - 166.4 acres)

This rating indicates the proportion of map units that meets the criteria for hydric soils. Map units are composed of one or more map unit components or soil types, each of which is rated as hydric soil or not hydric. Map units that are made up dominantly of hydric soils may have small areas of minor nonhydric components in the higher positions on the landform, and map units that are made up dominantly of nonhydric soils may have small areas of minor hydric components in the lower positions on the landform. Each map unit is designated as "all hydric," "partially hydric," "not hydric," or "unknown hydric," depending on the rating of its respective components.

"All hydric" means that all components listed for a given map unit are rated as being hydric, while "not hydric" means that all components are rated as not hydric. "Partially hydric" means that at least one component of the map unit is rated as hydric, and at least one component is rated as not hydric. "Unknown hydric" indicates that at least one component is not rated so a definitive rating for the map unit cannot be made.
Hydric soils are defined by the National Technical Committee for Hydric Soils (NTCHS) as soils that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part (Federal Register, 1994). Under natural conditions, these soils are either saturated or inundated long enough during the growing season to support the growth and reproduction of hydrophytic vegetation.

The NTCHS definition identifies general soil properties that are associated with wetness. In order to determine whether a specific soil is a hydric soil or nonhydric soil, however, more specific information, such as information about the depth and duration of the water table, is needed. Thus, criteria that identify those estimated soil properties unique to hydric soils have been established (Federal Register, 2002). These criteria are used to identify map unit components that normally are associated with wetlands. The criteria used are selected estimated soil properties that are described in "Soil Taxonomy" (Soil Survey Staff, 1999) and "Keys to Soil Taxonomy" (Soil Survey Staff, 2006) and in the "Soil Survey Manual" (Soil Survey Division Staff, 1993).

If soils are wet enough for a long enough period of time to be considered hydric, they should exhibit certain properties that can be easily observed in the field. These visible properties are indicators of hydric soils. The indicators used to make onsite determinations of hydric soils are specified in "Field Indicators of Hydric Soils in the United States" (Hurt and Vasilas, 2006).

<table>
<thead>
<tr>
<th>Permit</th>
<th>Regulatory Agency Applicability</th>
<th>Timeline</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>WETLANDS</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Clean Water Act Sections 401 and 404</td>
<td>NC - Division of Water Quality</td>
<td>A permit is required prior to the deposition of fill, earth, construction debris, and soil in an isolated wetland. WSP has not identified any specific buffer distance or other requirements applicable to the Cape Fear Watershed where Clinton is located. A riparian buffer distance of 50 feet applies generally to new construction near water bodies in other areas of the State. Construction of temporary sediment control measures or best management practices as required by the NC Sediment and Erosion Control Program on a construction site is deemed to comply with wetlands standards, provided that the temporary sediment control measures or best management practices are restored to natural grade and stabilized within two months of completion of the project and native woody vegetation is reestablished during the next appropriate planting season and maintained thereafter.</td>
</tr>
<tr>
<td><strong>MATERIAL STORAGE</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Emergency Planning and Community Right-to-Know Act, SARA Title III</td>
<td>NC DENR</td>
<td>A facility must report hazardous substances stored onsite above threshold planning quantities (TPQ) to the State Emergency Response Commission (SERC), Local Emergency Planning Committee (LEPC), and the local fire department. Section 302 - Extremely hazardous substance (EHS) notification (one time notification) - Includes sulfuric acid and any other EHS onsite above the TPQ Section 311 - MSDS submission (one time notification) - Includes potassium chloride, urea, and any other hazardous substance above the TPQ Section 312 - Tier II reporting form - Includes potassium chloride, urea, and any other hazardous substance above the TPQ</td>
</tr>
<tr>
<td><strong>BUILDING AND ZONING</strong></td>
<td></td>
<td></td>

A facility wishing to establish an alcohol fuel plant must apply for and obtain an alcohol fuel producer's permit.
Rural Development
Environmental Justice (EJ) and Civil Rights Impact Analysis (CRIA)
Certification

1. Applicant's name and proposed project description: ChemTex International, Inc., NC
   Biorefinery to produce cellulosic ethanol from energy grasses

2. Rural Development's loan/grant program/guarantee or other Agency action: Section 9003, RBCS

3. [✓] Attach a map of the proposal's area of effect identifying location or EJ populations, location of the proposal, area of impact or
   [✓] Attach results of EJ analysis from the Environmental Protection Agency's (EPAs) EnviroMapper with proposed project location and impact footprint delineated.

4. Does the applicant's proposal or Agency action directly, indirectly or cumulatively affect the quality and/or level of services provided to the community?
   □ Yes  [✓] No  □ N/A

5. Is the applicant's proposal or Agency action likely to result in a change in the current land use patterns (types of land use, development densities, etc.)?
   □ Yes  [✓] No  □ N/A

6. Does a demographic analysis indicate the applicant's proposal or Agency's action may disproportionately affect a significant minority and/or low-income populations?
   □ Yes  [✓] No  □ N/A

If answer is no, skip to item 12. If answer is yes, continue with items 7 through 12.

7. Identify, describe, and provide location of EJ population ________________________________

8. If a disproportionate adverse affect is expected to impact an EJ population, identify type/level of public outreach implemented. ________________________________

9. Identify disproportionately high and adverse impacts on EJ populations. ________________________________

10. Are adverse impacts appreciably more severe or greater in magnitude than the adverse impacts expected on non-minority/low-income populations?
    □ Yes  □ No  □ N/A

11. Are alternatives and/or mitigation required to avoid impacts to EJ populations?
    □ Yes  □ No  □ N/A

If yes, describe ________________________________

12. I certify that I have reviewed the appropriate documentation and have determined that:
    [✓] No major EJ or civil rights impact is likely to result if the proposal is implemented.
    A major EJ or civil rights impact is likely to result if the proposal is implemented.

Source: U.S. Census Bureau, 2005-2009 American Community Survey

Data are based on a sample and are subject to sampling variability. The degree of uncertainty for an estimate arising from sampling variability is represented through the use of a margin of error. The value shown here is the 90 percent margin of error. The margin of error can be interpreted roughly as providing a 90 percent probability that the interval defined by the estimate minus the margin of error and the estimate plus the margin of error (the lower and upper confidence bounds) contains the true value. In addition to sampling variability, the ACS estimates are subject to nonsampling error (for a discussion of nonsampling variability, see Accuracy of the Data). The effect of nonsampling error is not represented in these tables.

Notes:
- Employment and unemployment estimates may vary from the official labor force data released by the Bureau of Labor Statistics because of differences in survey design and data collection. For guidance on differences in employment and unemployment estimates from different sources go to Labor Force Guidance.
- Workers include members of the Armed Forces and civilians who were at work last week.
- Occupation codes are 4-digit codes and are based on Standard Occupational Classification 2000.
- Industry codes are 4-digit codes and are based on the North American Industry Classification System 2002 and 2007. The 2005, 2006, and 2007 ACS data are coded using NAICS 2002 while the 2008 and 2009 ACS data use NAICS 2007 codes. Categories that differ between 2002 and 2007 NAICS are aggregated so that the 5 years of data are consistent in display and reflect the NAICS 2007 codes. The industry categories adhere to the guidelines issued in Clarification Memorandum No. 2, "NAICS Alternate Aggregation Structure for Use By U.S. Statistical Agencies," issued by the Office of Management and Budget.
- Selected earnings and income data are not available for certain geographic areas due to problems with group quarters data collection and imputation. See the ACS User Notes for details.
- Logical coverage edits applying a rules-based assignment of Medicaid, Medicare and military health coverage were added in 2009 -- please see http://www.census.gov/hhes/www/htsnews/publications/coverage_edits_final.pdf for more details.
- While the 2005-2009 American Community Survey (ACS) data generally reflect the November 2008 Office of Management and Budget (OMB) definitions of metropolitan and micropolitan statistical areas, in certain instances the names, codes, and boundaries of the principal cities shown in ACS tables may differ from the OMB definitions due to differences in the effective dates of the geographic entities.
- Estimates of urban and rural population, housing units, and characteristics reflect boundaries of urban areas defined based on Census 2000 data. Boundaries for urban areas have not been updated since Census 2000. As a result, data for urban and rural areas from the ACS do not necessarily reflect the results of ongoing urbanization.

Explanation of Symbols:
1. An "**" entry in the margin of error column indicates that either no sample observations or too few sample observations were available to compute a standard error and thus the margin of error. A statistical test is not appropriate.
2. An "*" entry in the estimate column indicates that either no sample observations or too few sample observations were available to compute an estimate, or a ratio of medians cannot be calculated because one or both of the median estimates falls in the lowest interval or upper interval of an open-ended distribution.
3. An "*" following a median estimate means the median falls in the lowest interval of an open-ended distribution.
4. An "*" following a median estimate means the median falls in the upper interval of an open-ended distribution.
5. An "***" entry in the margin of error column indicates that the median falls in the lowest interval or upper interval of an open-ended distribution. A statistical test is not appropriate.
6. An "****" entry in the margin of error column indicates that the estimate is controlled. A statistical test for sampling variability is not appropriate.
7. An 'N' entry in the estimate and margin of error columns indicates that data for this geographic area cannot be displayed because the number of

Re: Chemtex International Inc., Alpha Biorefinery, Turkey Highway, Clinton, Sampson County, ER 11-0795

Dear Ms. Cutbirth:

Thank you for your letter of May 5, 2011, concerning the above project. We appreciate your and Wesley Wilcox’s providing additional information to identify the parcels that will be disturbed by construction, and to establish that the two cemeteries noted as being within the southeastern portion of Parcel C (Option 2) are outside the project’s APE (area of potential effect).

With these clarifications made, we have conducted a review of the proposed project and are aware of no historic resources which would be affected by the project. Therefore, we have no comment on the project as proposed.

The above comments are made pursuant to Section 106 of the National Historic Preservation Act and the Advisory Council on Historic Preservation’s Regulations for Compliance with Section 106 codified at 36 CFR Part 800.

Thank you for your cooperation and consideration. If you have questions concerning the above comment, please contact Renee Gledhill-Earley, environmental review coordinator, at 919-807-6579. In all future communication concerning this project, please cite the above-referenced tracking number.

Sincerely,

Renee Gledhill-Earley

Re: Chemtex Group- Construction of a Biorefinery in Sampson County, NC  

Dear Ms. Cutbirth:  

This letter is to inform you that a list of all federally-protected endangered and threatened species with known occurrences in North Carolina is now available on the U.S. Fish and Wildlife Service’s (Service) web page at http://www.fws.gov/raleigh. Therefore, if you have projects that occur within the Raleigh Field Office’s area of responsibility (see attached county list), you no longer need to contact the Raleigh Field Office for a list of federally-protected species.  

Our web page contains a complete and frequently updated list of all endangered and threatened species protected by the provisions of the Endangered Species Act of 1973, as amended (16 U.S.C. 1531 et seq.)(Act), and a list of federal species of concern¹ that are known to occur in each county in North Carolina.  

Section 7 of the Act requires that all federal agencies (or their designated non-federal representative), in consultation with the Service, insure that any action federally authorized, funded, or carried out by such agencies is not likely to jeopardize the continued existence of any federally-listed endangered or threatened species. A biological assessment or evaluation may be prepared to fulfill that requirement and in determining whether additional consultation with the Service is necessary. In addition to the federally-protected species list, information on the species’ life histories and habitats and information on completing a biological assessment or evaluation and can be found on our web page at http://www.fws.gov/raleigh. Please check the web site often for updated information or changes.  

¹ The term “federal species of concern” refers to those species which the Service believes might be in need of concentrated conservation actions. Federal species of concern receive no legal protection and their designation does not necessarily imply that the species will eventually be proposed for listing as a federally endangered or threatened species. However, we recommend that all practicable measures be taken to avoid or minimize adverse impacts to federal species of concern.
If your project contains suitable habitat for any of the federally-listed species known to be present within the county where your project occurs, the proposed action has the potential to adversely affect those species. As such, we recommend that surveys be conducted to determine the species’ presence or absence within the project area. The use of North Carolina Natural Heritage program data should not be substituted for actual field surveys.

If you determine that the proposed action may affect (i.e., likely to adversely affect or not likely to adversely affect) a federally-protected species, you should notify this office with your determination, the results of your surveys, survey methodologies, and an analysis of the effects of the action on listed species, including consideration of direct, indirect, and cumulative effects, before conducting any activities that might affect the species. If you determine that the proposed action will have no effect (i.e., no beneficial or adverse, direct or indirect effect) on federally listed species, then you are not required to contact our office for concurrence (unless an Environmental Impact Statement is prepared). However, you should maintain a complete record of the assessment, including steps leading to your determination of effect, the qualified personnel conducting the assessment, habitat conditions, site photographs, and any other related articles.

With regard to the above-referenced project, we offer the following remarks. Our comments are submitted pursuant to, and in accordance with, provisions of the Endangered Species Act.

Based on the information provided and other information available, it appears that the proposed action is not likely to adversely affect any federally-listed endangered or threatened species, their formally designated critical habitat, or species currently proposed for listing under the Act at these sites. We believe that the requirements of section 7(a)(2) of the Act have been satisfied for your project. Please remember that obligations under section 7 consultation must be reconsidered if: (1) new information reveals impacts of this identified action that may affect listed species or critical habitat in a manner not previously considered; (2) this action is subsequently modified in a manner that was not considered in this review; or, (3) a new species is listed or critical habitat determined that may be affected by the identified action.

However, the Service is concerned about the potential impacts the proposed action might have on aquatic species. Aquatic resources are highly susceptible to sedimentation. Therefore, we recommend that all practicable measures be taken to avoid adverse impacts to aquatic species, including implementing directional boring methods and stringent sediment and erosion control measures. An erosion and sedimentation control plan should be submitted to and approved by the North Carolina Division of Land Resources, Land Quality Section prior to construction. Erosion and sedimentation controls should be installed and maintained between the construction site and any nearby down-gradient surface waters. In addition, we recommend maintaining natural, vegetated buffers on all streams and creeks adjacent to the project site.

The North Carolina Wildlife Resources Commission has developed a Guidance Memorandum (a copy can be found on our website at http://www.fws.gov/raleigh) to address and mitigate secondary and cumulative impacts to aquatic and terrestrial wildlife resources and water quality. We recommend that you consider this document in the development of your projects and in completing an initiation package for consultation (if necessary).
We hope you find our web page useful and informative and that following the process described above will reduce the time required, and eliminate the need, for general correspondence for species’ lists. If you have any questions or comments, please contact John Ellis of this office at (919) 856-4520 ext. 26.

Sincerely,

[Signature]

Chemtex NC 24 Rail Site
Clinton, Sampson County, NC
ECS Project: 18524
July 8, 2011

Tom Vilsack, Secretary of Agriculture
U.S. Department of Agriculture
1400 Independence Ave., S.W.
Washington, DC 20250

Mr. Vilsack,

I am writing to provide details on our investigation and requirements for access on the proposed Chemtex site located just east of Clinton, NC on NC 24 highway.

There are several items that I would like to address. They are listed below:

1) Current traffic count on NC 24 East in vicinity of SR 1232 (East Railroad Street) is 8700 vehicles per day per our 2009 traffic count. The traffic count on SR 1232 is 2500 vehicles per day.
2) There would not be any restrictions on truck traffic at this site
3) There are two options for roadway improvements for this site for site access.
   A) Install the driveway access on the eastern side of the property to avoid conflict with the existing four lane section and construct a left turn lane and right turn lane, both with 150’ minimum storage and 150’ bay tapers.
   B) Install the driveway access closer to the western side of the property and extend the existing four lane section down past the site and stripe the inside west bound lane for a dedicated left into the development and stripe the outside east bound lane for a right turn lane into the development.
4) There is not data for a truck load. The existing NC 24 road is paved with asphalt on top of a concrete slab. Load is not an issue on this section of roadway.

Conclusion: The research performed by the Clinton District staff supports the four issues addressed above. The data and information provided as of the date of this letter is the proposed requirements the NCDOT will require the developer to address on a driveway permit. If any changes in conditions occur prior to the issuance of a driveway permit, the NCDOT may require another review of the above requirements.
If more information is needed, please call me at 910-592-6174.

Sincerely,

[Signature]

Mr. L.E. Reynolds, PE
District Engineer

Fort Bragg, NC 28310

Dear Ms. Cutbirth:

Re: SCH File # 12-E-0000-0009; SCOPING; Development of a bioethanol production plant located along the Turkey Highway in the City of Clinton that will produce 20 million gallons per year of bioethanol

The above referenced environmental impact information has been submitted to the State Clearinghouse under the provisions of the National Environmental Policy Act. According to G.S. 113A-10, when a state agency is required to prepare an environmental document under the provisions of federal law, the environmental document meets the provisions of the State Environmental Policy Act. Attached to this letter for your consideration are the comments made by agencies in the course of this review.

If any further environmental review documents are prepared for this project, they should be forwarded to this office for intergovernmental review.

Should you have any questions, please do not hesitate to call.

Sincerely,

Sheila Green

MEMORANDUM

To: Melba McGee  
Office of Legislative and Intergovernmental Affairs, DENR

From: Molly Ellwood  
Southeastern Permit Coordinator  
Habitat Conservation Program

Date: August 15, 2011

RE: Project Scoping for Chemtex Group Project Alpha for a Bioethanol Production Plant in Sampson County; OLIA No. 12-0089

This memorandum responds to a request for our concerns regarding impacts on fish and wildlife resources resulting from the subject project. Biologists with the N. C. Wildlife Resources Commission (NCWRC) have reviewed the proposed project. Our comments are provided in accordance with certain provisions of the North Carolina Environmental Policy Act (G.S. 113A-1 through 113A-16; 1 NCAC 23) and the Fish and Wildlife Coordination Act (48 Stat. 401, as amended; 16 U.S.C. 661-667d).

Chemtex International, Inc is requesting scoping comments for a potential bioethanol production plant in Sampson County. Chemtex Project Alpha is expected to produce 20 million gallons per year of bioethanol and develop downstream sustainable chemicals. The selected site for the facility is south of Turkey Highway in Clifton and the nearest waterbody is an unnamed tributary that runs into Chestnut Pond which then runs into the Rowan Branch.

Due the preliminary nature of the information provided, the NCWRC does not have any specific concerns regarding this project at this time. However, to help facilitate future document preparation and the review process, our general informational needs are outlined below:

1. Please include a description of any streams or wetlands that may be affected by the project and how these impacts have been avoided and minimized to the greatest extent practicable.

2. Cover type maps showing wetland acreages impacted by the project. Wetland acreages should include all project-related areas that may undergo hydrologic change as a result of ditching, other drainage, or filling for project construction. Wetland identification may be accomplished through coordination with the U. S. Army Corps of Engineers (USACE). If the
USACE is not consulted, the person delineating wetlands should be identified and criteria listed.

3. Mitigation for avoiding, minimizing or compensating for direct and indirect degradation in habitat quality as well as quantitative losses that result from the project.

4. Please clearly explain where the cellulose material will be coming from and if there will be any environmental impacts associated with the production and transportation of the raw materials.

5. Due to potential environmental impacts associated with water discharges, please explain where the wastewater from the production plant will be discharged or treated.

6. The scoping document provided discusses how the proposed site was selected because of its location. Please provide information in future documents that explains that the current infrastructure is suitable for the expected production and that future changes to the current infrastructure may or may not be requested as a result of the plant.

7. Please provide a detailed alternative analysis concerning the selection of this site and how it compares to other sites that were explored for this project. The site with the least environmentally damaging design should be selected as the preferred alternative.

8. Discuss the cumulative impacts of secondary development facilitated by the proposed project. Such discussion should weigh the economic benefits of such growth against the costs of associated environmental degradation.
   
   (a) Include specific requirements for both residential and industrial developments and Best Management Practices (BMPs) that will be required.

   (b) Include specific measures that will be used to protect stream corridors, riparian habitat, and a minimum of the 100-year floodplain from filling and development.

We offer the following recommendations to address secondary and cumulative impacts and to reduce impacts to aquatic and terrestrial wildlife resources. Additional information regarding these recommendations can be found in NCWRC's Guidance Memorandum to Address and Mitigate Secondary and Cumulative Impacts to Aquatic and Terrestrial Wildlife Resources and Water Quality (August 2002). This document is located on the web at: http://www.ncwildlife.org/pg07_WildlifeSpeciesCon/ec7c3_impacts.pdf.

9. Description of fishery and wildlife resources within the project area, including a listing of federally or state designated threatened, endangered, or special concern species. A listing of designated plant species can be developed through consultation with:

   NC Natural Heritage Program
   Dept. of Environment & Natural Resources
   1601 Mail Service Center
   Raleigh, NC 27699-1501
   (919) 733-7795

and,

   NCDA Plant Conservation Program
Thank you for the opportunity to provide input in the early planning stages for this project. If we can further assist your office, please contact me at (919) 733-3610.
MEMORANDUM

TO:        Melba McGee
            Department of Environment and Natural Resources

THRU:     Jeff Manning, Supervisor
            Basinwide Planning Unit

FROM:     Hannah Stallings, DWQ's SEPA Coordinator

SUBJECT: Sampson County – Scoping for Bioethanol Production Plant
          DWQ#143777; DRNR#12-0009.

The Division of Water Quality (DWQ) has reviewed the subject scoping document. Several areas of the scoping document were unclear and we request clarified responses on the following:

1. Part 1 states that “preliminary work has already begun.” Please clarify what is covered under this “preliminary work” as no ground should be disturbed prior to this project receiving a Finding of No Significant Impact.

2. Several areas of the scoping document have several answers for the same question: section 1 of part 1 on page 1; section C of part 2 on page 2; item 4 of section F of part 2 on page 3; and item 3 of section G of part 2 on page 3. Please clarify which of the boxes should be marked.

3. Section A, Part 2, page 2 – Please clarify what land use is on the remaining 10% of unaccounted for project space.

4. Section D, Part 2, Page 2 – Please clarify the percentage of the total project area for the cited acreages.

5. Page 3 – While Item 3, Section B, on page 5 states that 69 jobs will be created, Item 5 states that only 65 jobs will be created. Please clarify which is the correct number.

6. Item 10 addresses impact on “important land resource[s]” and not surface waters as indicated in the prompt. Please clarify if any surface waters will be impacted by the proposed project.

The following comments are offered to assist Chemtex International, Inc., in its planning process for the proposed facility and in the environmental document that will be prepared for this project:

1. Please clarify whether the infrastructure and volumes cited in sections B and C of part 2 on page 2 refer to existing and future plans or whether the numbers in section C should be different. That is, will this project double the amount of water to be provided and wastewater to be treated from the proposed facility or will the needed capacity of each double once the proposed project is constructed?

2. Item 9 in Section G of Part 2 on Page 4 states that “No mitigation measures have yet been taken for the Project and none are expected.” If 76 acres of land will be cleared as indicated on page 2, then sediment and erosion control measures should be used to lessen the project’s impact on local surface waters.
Also, insufficient information was provided in regard to the wastewater infrastructure that will support the proposed project. The following information is needed in future environmental documentation:

1. Provide a hydraulic analysis for the sewer collection system downstream of the project. The analysis should include the existing capacity for the 8-inch receiving line, downstream collection system (including pump stations, force mains, etc.). Clarify if the system can handle the additional flow or if modifications will be required.

2. Provide a general history of sanitary sewer overflows (SSOs) over the past five years within the sewer shed where the project will occur. If a substantial amount of SSOs have been reported, describe the effect the project will have on potential future SSOs.

3. Provide the current condition of Clinton’s Wastewater Treatment Plant and its ability to handle the additional flow and loads from the project. Include within this discussion any Notices of Violation (NOVs) that have occurred at the facility and the effect the project may have on future NOVs. Per page 8 of the scoping document it appears that the additional flow from project (550,000 GPD) will push the facility past the 80% threshold of the system’s permitted hydraulic capacity. Clarify the existing hydraulic capacity of the system (based on the average flow of the last calendar year) and if this exceeds the 80% threshold, discuss if the municipality has evaluated plans for future expansions.

4. DWQ contacted the City of Clinton in regards to this project and was informed that the City has limited knowledge concerning the technical aspects of it. It is strongly suggested that the City be informed and provide comments into the affects the additional flow and industrial load will have on the City's collection and treatment system.

Please contact me at 807-6434 if I can be of any further assistance.

Thank you.

MEMORANDUM

FROM: Jim Mead, SEPA Review Coordinator - DWR

TO: Melba McGee, Environmental Projects Officer - DENR

SUBJECT: Bioethanol Production Plant
City of Clinton
Request for Scoping Comments
DENR Project No. 12-0009

The Division of Water Resources (DWR) has reviewed the scoping request and has the following comments.

In accordance with Session Law 2010-150, local governments and community water systems must address foreseeable future water needs when 80% of a water system's available water supply has been allocated, or when seasonal demand exceeds 90% of the available supply. Based on data submitted in the 2010 Local Water Supply Plan, an additional 1 MGD demand would create an allocation beyond 80% of available supply for Sampson County Water District I.

Therefore, Sampson County Water District I needs to show how it will address foreseeable future water needs in accordance with State law with a projected increase in demand of 1 MGD by the proposed bioethanol facility.

For questions regarding these comments, please contact Vardry Austin, 919-715-5422, or Vardry.austin@ncdenr.gov.

PUBLIC WATER SUPPLY SECTION

Inter-Agency Project Review Response

Project Name: USDA-RD/Chemtex International Inc
Type of Project: Scoping - Development of bioethanol production plant along Yakima Hwy in City of Clinton that will produce 20 million gallons per year of ethanol

☑️ The applicant should be advised that plans and specifications for all water system improvements must be approved by the Division of Water Resources/Public Water Supply Section prior to the award of a contract or the initiation of construction (as required by 15A NCAC 16C .0300et seq.). For information, contact the Public Water Supply Section, (919) 733-2321.

☐ This project will be classified as a non-community public water supply and must comply with state and federal drinking water monitoring requirements. For more information the applicant should contact the Public Water Supply Section, (919) 733-2321.

☑️ If existing water lines will be relocated during the construction, plans for the water line relocation must be submitted to the Division of Water Resources, Public Water Supply Section, Technical Services Branch, 1634 Mail Service Center, Raleigh, North Carolina 27695-1634, (919) 733-2321.

After a review of the Bioethanol Production Plant project document, I would like to offer a few minor comments. After reviewing your application it has been determined that the Bioethanol Production Plant is in close proximity of project R-2303: NC 24, starting from SR 1003 to I-40. Widen to four lanes divided. Planning/Design in progress. Please coordinate with the Town’s administration to avoid any potential conflicts.

Subject: Intergovernmental Review State Number: 12-E-0000-0009
Chemtex International Inc.

As requested by the North Carolina State Clearinghouse, the North Carolina Department of Crime Control and Public Safety Division of Emergency Management Office of Geospatial and Technology Management (GTM) reviewed the proposed project listed above and offer the following comments:

1) Sampson County participates in the National Flood Insurance Program and enforces a Flood Damage Prevention Ordinance that requires a Floodplain Development Permit be issued for all development located in the Special Flood Hazard Area, SFHA (100 year floodplain), within their jurisdiction. The proposed project site includes the SFHA of Rowan Branch (see attachment). Please ensure the Floodplain Administrator for Sampson County reviews and issues a permit for the proposed project.

2) Rowan Branch has been studied by the North Carolina Floodplain Mapping Program (NCFMP) by limited detailed methods and has non-encroachment areas. Construction within a non-encroachment area requires, prior to construction, approval of either a no-rise study with a no-rise certification for projects that do not increase base flood elevation or for projects that result in an increase in base flood elevations the approval of a Conditional Letter of Map Revision.
Thank you for your cooperation and consideration. If you have any questions concerning the above comments, please contact Dan Brubaker, P.E., CFM, the NC NFIP Engineer at (919) 715-5711 ext. 110, by email at dbrubaker@ncem.org or at the address shown on the footer of this document.

Sincerely,

STATEMENT OF MID-CAROLINA COUNCIL OF GOVERNMENTS
IN SUPPORT OF CHEMTEX PROJECT IN SAMPSON COUNTY

The Chemtex Project ALPHA will provide tremendous benefit to the agricultural economy of Sampson County. The project's total direct jobs created will be 65 by the year 2014 with a total taxable investment estimated at $80 million. The Chemtex Project is an important step towards North Carolina achieving its goal of utilizing forestry and non-foods agriculture biomass resources as feedstock to produce biofuels. The estimated annual production capacity is 20 million gallons of ethanol for use as fuel. In addition, the hog lagoon irrigation fields would produce a higher economic yield than current production of hay. The project will use City of Clinton utilities, Progress Energy electric service and Piedmont Natural Gas, and will be a major asset to the entire region.

Mr. Paolo Carollo  
Executive Vice President  
Chemtex International, Incorporated  
1979 Eastwood Road  
Wilmington, North Carolina 28403  

Dear Mr. Carollo:

It is our pleasure to inform you that at a public hearing held on Tuesday, July 5, 2011 that the Sampson County Board of Commissioners unanimously approved support for a 20,000,000 gallon per year cellulosic biofuels production facility of Chemtex International, Inc. (Chemtex) locating within Sampson County. Specifically, the Commissioners approved providing Chemtex with a financial incentive package totaling an estimated $2,870,688 over the first 6-years of the facility’s operations.

This proposed Chemtex cellulosic biofuels production facility would be a great fit for Sampson County and our surrounding region. We recognize that one of the benefits of this facility would be increased yields and revenues for farmers who would grow energy grass feedstock on hog lagoon spray fields currently under cultivation with Bermuda grass. We estimate that if 15,000 acres of existing spray fields in Sampson County were to grow energy grasses the annual revenue to farmers would increase to $9,000,000, a 50% increase over the cultivation of Bermuda grass.

It is the goal of this grant back incentive package to support Chemtex in the lease and purchase of a 166.4 acre industrial site located on NC-24 east of City of Clinton. We understand the development of this facility is dependent on Chemtex obtaining the conditional loan guarantee from the United States Department of Agriculture as part of the USDA 9003 Biorefinery Assistance Program. We support Chemtex’s application to obtain this loan guarantee and offer our assistance in this effort.

If Chemtex accepts this financial incentive the terms of this contract between Sampson County and Chemtex International, Inc. will be stated within an Incentive Agreement between these two parties. This financial incentive and agreement comply with the existing Sampson County Economic Development Investment Incentive Policy.

Again, we are pleased to be able to offer this financial incentive to support the development of this facility in Sampson County. We welcome each opportunity to be of assistance in this work.

Sincerely yours,

John D. Swope  
Executive Director

Cc:  - The Honorable Jefferson Strickland, Chairman, Sampson County Board of Commissioners  
     - Mr. Ed Causey, County Manager, County of Sampson
Appendix H
The North Carolina hog industry uses Sprayfield Land to remediate hog waste.

Sprayfield land managers mostly grow Bermuda grass, for which there is a limited market in NC.

- The use of energy grasses in place of Bermuda grass will benefit the sprayfield land managers.
  - The higher yielding energy grass will remediate more nutrients.
  - The energy grasses will be sold as feedstock for the facility.
  - This change will convert marginal land into productive land.

Within the three county region of Duplin, Wayne, and Sampson there are 100,000 acres of sprayfield land which can support 5-6 facilities the size of Project Alpha when converted to energy grasses.
Establishing New Supply Chains

Yields beyond 20 ton per acre
• Planting and harvesting of energy grasses can be accomplished with existing equipment
• The tools currently used to apply the lagoon effluent to the sprayfields can be used with the taller energy grasses with minor modifications

Sprayfield equipment, Traveling Gun

Traveling gun irrigation devices are widely used for spraying effluent in NC.

Minor modification is required on this equipment (extension to the height of the water nozzle to clear energy grasses). Cost estimated for this modification is negligible.
Sprayfield equipment, Center Pivot

Center Pivot irrigation devices widely used for spraying effluent in NC.

No significant modifications are required.
